adopted different methods. Some have systematically classed the subject of law, and have treated separately the history of each subject. Thus, in one book or section, may be found the history of the law of persons; in another, that of property; in a third, that of successions; in a fourth, that of obligations; in a fifth, that of actions.

Law.

Syn-
chro-
nistic
and
successive
systems of
legal his-
tory.

Other writers divide the history of Roman law into periods, and give a complete view of every department of law in one period before they proceed to the next. This mode of writing the history of law has been called *synchronismus*, and there has been much dispute among jurists whether it is to be preferred to the former mode which treats successively of different subjects from the beginning to the end of the history of each. Both plans have their respective advantages and disadvantages. If the synchronistic plan gives a more commanding *coup d'œil* of a given period, and traces more accurately the relations of different parts, and the mutual influence of contemporaneous changes; the chronological or successive presents more distinct views of separate departments, does not distract the attention by bounding from one topic to another, and is exempt from the objection of grouping together subjects whose relative velocities and *crises* of development are so different, that the natural halting-places in the history of one are unsuitable to the history of another.

Gibbon, in the 44th chapter of his *Decline and Fall*, divided, as others had done before him, the history of the Roman law, up to the reign of Justinian, into periods, and his division presents such marked differences in the successive periods that, with slight alteration, it has been followed by Hugo. Hugo, *ö pärv*, translated into German, and annotated this celebrated chapter, and Warnkœnig published at Liege, in 1821, Guizot's French translation under the title, "*Précis de l'Histoire du Droit Romain, par E. Gibbon*," adding his own and Guizot's notes to a selection from Hugo's. In place of the words *moveable* and *immoveable*, Gibbon uses *real* and *personal*, in the sense familiar to English readers. He falls into some positive errors, but his well-arranged, luminous, and comprehensive sketch shows the master's hand.

Notices of
some of the
Histories
of Roman
law.

We shall now mention some of the principal historians of Roman law both before and after the publication of the *Decline and Fall*. The fragment of the *Enchiridion* of Pomponius (*De Origine Juris*), which has been preserved in the second title of the first book of the *Digest* or *Pandects* of Justinian, is the principal ancient authority professedly treating of the history of Roman law. It has been commented on by Bynkershoek, (*Oper.* vol. 4, Lug. Bat. 1743, p. 1) and Vandermaelen; and the valuable preface of Heineccius (*Opera*, tom. iii. sect. 2, p. 66), to J. L. Uhlii *Opuscula ad Historiam Juris pertinentia* (Hall, 1735), may be consulted with advantage. One of the last editions is that of Pernice, Göttingen, 1822. This fragment, which Gibbon supposes to have been abridged, and probably corrupted, by Tribonian, is, in many parts, difficult and obscure.

The works of Sigonius, *De Antiquo Jure Civium Romanorum*, *de Antiquo Jure Provinciarum*, and *De Judiciis*, are among the most valuable early historical essays on Roman law. Notwithstanding the more accurate information upon some points furnished by the recent researches of Niebuhr, Savigny, and Madwig, the materials collected by Sigonius will be always of great use to the scholar.

Law.

Jac. Gothofredi *Manuale Juris* contains one of the earliest systematic histories of Roman law. It has great merit, and is still popular in France. There is an edition by Berthelot, 8vo. Paris, 1806.

J. V. Gravina, *Origines Juris Civilis* (with the notes of Mascovius, Leipzig, 1737; and of Sergius, Naples, 1756—58), is celebrated for the excellence of its rather diffuse and declamatory latinity. It contains a great variety of valuable information, and, in spite of some inaccuracies, will be consulted with pleasure.

J. Gottl. Heineccii, *Historia Juris Romani et Germanici*. The later editions of this well-known work are enriched by the Notes of Ritter and Silberrad (and Kugler?). It treats chiefly the external history of Roman law. In the excellent *Antiquitatum Romanarum Syntagma* of the same author (of which the last edition is that of Mühlenbruch, Frankfurt, 1841, incorporating the notes of Haubold), the internal contents of Roman law are arranged according to the order of Justinian's *Institutes*, and each subject in succession is treated historically. Heineccius was deemed by Sir James Mackintosh (*See his Discourse on the Law of Nature and Nations*) to have been the best writer of elementary works that ever lived,—not even excepting Euclid. Heineccius has the art of writing clearly, concisely, and intelligibly. He begins at the beginning, and unfolds his subject regularly, citing the most material authorities at sufficient length in his text, instead of taking for granted much subsidiary knowledge in his reader, and merely referring to many books which it might be troublesome and inconvenient to consult. It is amusing to read the contemptuous criticisms of some modern authors upon the works of Heineccius, and to view the small holes they attempt to pick. Let, for example, Hugo have espoused a different side from Heineccius on some doubtful question, and straightway they set down Heineccius as guilty of error. They sometimes blame him for being ignorant of facts only brought to light by recent discoveries. The writer of a critique on Adam's *Roman Antiquities* in the 4th volume of the *Thémis*, p. 365, says of Adam, "*Il suit pas à pas Heineccius, que toute l'Ecosse prend encore pour guide, lorsque l'Allemagne et la France l'ont délaissé.*" One of the principal faults of Heineccius, in common with the civilians of his day, is the use of technical expressions, of barbarous latinity, though sometimes clear and expressive, in place of the classical phraseology of the ancient Roman juriconsults. Thus, he speaks of *obligationes, reales, verbales, literales, consensuales*, instead of "*obligationes, quæ re, verbo, literâ et consensu contrahuntur.*" He was imperfectly versed in the remains of Ante-Justinian law. The notes of Haubold on his *Antiquitatum Rom. Syntagma* are very good but short. The notes of Mühlenbruch and the portions of new text written by him are learned, but remarkable for the inelegance of style* which characterizes the works of this author. The title, *De Actionibus*, (lib. iv. tit. 6) is left in a very confused state from the mixture of heterogeneous materials. A skilful hand is required neatly to restore a valuable old work.

The *Historia Jurisprudentiæ Romanæ* of Bach is a convenient and satisfactory book of reference. It

* In lib. iv. tit. 6, s. 24, we observe the following specimen of Latin grammar: "*Neque verò propter damnum infectum illâ etiam ætate usu venit legis actio, si quidem commodiore et pleniore jure uti poterant cives Romani, ex quo stipulatio damni infecti nomine præstanda præponerat prætor.*"

has been pronounced by Haubold,—a most competent judge,—to be "*liber aureus, tironum manibus nunquam excutiendus.*" The last edition of this work appeared, Leipzig, 1807, with the notes of Stockmann. Dr. Irving, misled possibly by the circumstantial announcement in Ersch's *Literatur der Jurisprudenz*, No. 234, asserts in his *Introduction to the Study of the Civil Law*, 4th edit. 1837, p. 189, n. 4, that "there are other editions of a more recent date." Wenck, Steinacker, and Schilling have been successively mentioned as engaged in preparing a new edition, which is much wanted.

Hugo's *History of Roman Law* (of which the 11th edition appeared in 1832) is the result of profound learning, combined with vigorous and original intellect. The style of the book is harsh and crabbed. It abounds in long and involved sentences. Facts and theories are often briefly and indirectly alluded to as known, and errors are often corrected, or important information conveyed, in a parenthesis. Schilling's *Kritik* (Leipzig, 1829) upon the 10th edition of this history is a useful accompaniment. Jourdan (not the late eminent doctor of law, but a doctor of medicine) translated, in French, the 7th edition of Hugo's work, but has not successfully performed his difficult task. He rarely assigns their proper force to the thickly-scattered particles, and not seldom misses or distorts the true sense. To use the words of Hugo himself, "he understood neither the law nor the language." There is an unfinished Latin translation by Warnkœnig.

Schweppe's clear and well-written history often affords satisfactory information not easy to be met with elsewhere. As an example of this, we may mention his explanation (p. 900 in sect. 522) of the "*senes ad coemptiones faciendas, interimendorum sacrorum causâ,*" alluded to by Cicero *pro Murænâ*, 12. The third edition, with notes by Gründler, was published at Göttingen in 1832. Hence it appears that Dr. John Reddie, in his *Historical Notices of the Roman Law*, (Edinburgh, 1826,) was mistaken in supposing that "Schweppe's attempt at a history of Roman law had fallen still-born from the press." Schweppe is often in opposition to Hugo, who is over-fond of novelty and minute criticism.

Zimmern's *History of Roman Law* is unfortunately left incomplete on account of the author's death. The first and third volumes only have been published, containing "*Private Law,*" and "*Civil Process.*" It is stated by Tigerström (*Innere Röm. Rechts-Geschichte*, p. 30,) that Huschke has undertaken to finish the work by writing a second volume. From the acuteness and originality which it displays, as well as its vast erudition, it is the most important contribution to the legal history of Rome since Hugo's book. The author's sentences are often carelessly composed, and his style has some of Hugo's defects.

The history finished by Professor Walter of Bonn, in 1840—the first part having appeared in 1834—is written in easy and perspicuous language, and, from the comprehensiveness of its view, may be recommended as exceedingly well calculated for the "*homo unius libri.*" Walter does not enter at length into the discussion of controverted points, but is judicious in his choice of results. A good translation of his book would be a valuable acquisition to English literature.

The number of professed histories of Roman law is so great that it would occupy too much space to mention them all. Tigerström's *Internal History* is a tole-

Law.

Law.

nable compilation, though it is not free from unsound views and inaccurate statements. The account it gives of the old law of procedure is carefully composed. In sect. 128, we observe that the author, from the error of supposing *lanx* to mean a lance, falls into some absurd misunderstandings of the authorities with respect to *furtum per lancem et licium conceptum*. The companion volume on *External History* appeared in 1841. It abounds in misprints and cannot be commended. Macieowski's *Historia Juris Romani* (Warsaw, 1825,) and Holtius, *Historiæ Juris Romani Lineamenta*, are short, and adapted to the use of commencing students. They chiefly follow Hugo. The brief outlines of Klenze (1835) and Rudorff (1841) are very useful from their well-chosen selection of authorities. The reader may consult with advantage the section on Roman law in Falck's *Juristische Encyclopädie*, of which the fourth edition has been translated into French by Pellat (Paris, 1841).

French
histories of
Roman
law.

In French, there is a short history by C. J. Ferrière, known in this country by an English translation. There are also slight sketches by A. M. J. J. Dupin, (*Précis Historique du Droit Romain*, Paris, 1825,) whose inaccurate little work has been translated into German and Spanish; and by Ortolan, *Histoire de la Législation Romaine*, (2nd edit. Paris, 1842). The agreeable essay of Warnkœnig, *Histoire Externe du Droit Romain* (Bruxelles, 1836), may be read by the student who will be content with a very rapid survey, but in several parts it requires further elucidation. The most ambitious works in French on the history of Roman law are those of Terrasson and Berriat St. Prix. The former is designated by Gibbon "pompous but feeble," and his work is stated to be "of more promise than performance." It derives some value from the "*veteris jurisprudentiæ Romanæ monumenta*" appended to it; but the text of these monuments is exhibited in a very corrupt state, and will be found more purely given in the collections of Spangenberg and Haubold, of which we shall presently speak. The work of Berriat St. Prix (Paris, 1821) contains the fruit of some original research, and furnishes much amusing anecdote and illustration. The author idolizes Cujas, whose life is subjoined to the history. In this respect (and in most others) he differs widely from Hugo, who frequently cites Cujas for the sake of finding fault. M. St. Prix is very severe in his treatment of the glossators, and a little blind to their merits. The English reader will (not unjustly) form an unfavourable opinion of his accuracy from the following curious passage, although, when M. St. Prix wrote, there was more foundation than now there is for his oddly mistaken representation of English law.

"Ici la surprise des modernes redouble. Sont-ce donc là, s'écrieront-ils, ces législateurs dont nous suivons encore, après vingt-cinq siècles, des décisions que les juristes vantent sans cesse? Mais les anciens pourraient récriminer dans cette occasion comme dans la précédente. Chez eux les actions des lois avaient été imaginées par la politique. Les Anglais, qui, choisissant en quelque sorte dans le droit Romain ce qu'il y a de plus défectueux, n'en ont retenu que les actions, pourraient-ils donner une semblable excuse? Comment justifieraient-ils entr'autres cette caution ridicule exigée pour l'obtention de leurs Writs peremptoires, qui sont proprement des actions des lois?—caution, dont ils ont tellement senti l'inutilité, que, malgré leur respect servile

pour leurs coutumes, ils la réduisent dans toutes les affaires à la simple prononciation de deux noms, John Doë et Richard Roë, qui ne designent que des individus imaginaires."—pp. 57, 58.

To this information are added the following reference and note. *Voy. Baert, Tableau de la Grande Bretagne*, (an 8 (1800), t. 2, p. 354, et suiv.)

"Lorsqu'il n'y a pas de Writ pour une action d'une espèce imprévue, (et tel était aussi l'inconvénient du système des Romains), il faut pour créer ce nouveau Writ, un Acte du Parlement." *Voy. ibid.* p. 353. "Ainsi, l'on met en mouvement toute l'autorité législative pour une formule inutile!"

In our own language, there is no separate work of much importance on the history of ante-Justinian law. Dr. Bever's *History of the Legal Polity of the Roman State* is a heavy book. It has been translated into German, and Schomberg's *Historical and Chronological View of the Roman Law*, into French. Mr. Charles Butler has given outlines of the history in his *Horæ Juridicæ Subsecivæ*. R. P. Burke's *Historical Essay, &c.* (2nd edit. 8vo., Cambridge, 1830) is the production of a man of cultivated mind and good sense. There is much historical information in that interesting repertory of miscellaneous learning, Dr. Taylor's *Elements of the Civil Law*.

Spence's *Inquiry into the Origin of the Laws and Political Institutions of Modern Europe*—an able and scholar-like performance—enters upon the legal history of the Roman provinces, and treads on ground which Savigny has since more minutely explored.

We subjoin the names of some of the works in various languages on the history of Roman law of which our limits do not permit us to give a detailed account.

With respect to the history of the history of Roman law, it is to be observed, that for a long time legal history was little attended to, but when, in the middle of the 16th Century, the study of it began to be diligently pursued, legal professors were generally contented to introduce historical remarks, as it were parenthetically, into their dogmatical lectures. In the 18th Century, separate lectures upon Roman history first became general. Works upon external history, which were the most common, were usually published under the title *Historia Juris Romani*; and works upon the internal history under the title *Antiquitates Juris Romani*. After Hugo, it became not unusual to blend external and internal history throughout; and, at the present day, systematic works under the title *History and Institutes of Roman Law*, making the knowledge of external history introductory to dogmatical information, are coming more and more into vogue.

Onuphrii Panvinii, *Reipublicæ Romanæ Commentariorum libri tres* (Paris, 1588).

Aymari Rivalii, *Civilis Historiæ Juris libri V.* (Mogunt. 1533).

Valentini Forsteri, *Historiæ Juris Civilis libri tres* (Basil, 1565): inserted also in the first volume of the great collection of Ziletus, usually known by the name of *Tractatus Tractatum*.

M. Ant. Ferratii, *Epistolarum (a) libri tres* (Patav. 1699); (b) *libri sex* (Venet. 1738).

G. Schubart, *De Fatis Jurisprudentiæ Romanæ, curâ Tillingii* (Lips. 1797).

Ch. G. Hoffmanni, *Historia Juris Romani* (tom. ii. Lips. 1718—26). A valuable work.

Law.

Law.

Jo. Sal. Brunquelli, *Historia Juris Romano-Germanici* (Amst. 1751).

Rud. Frid. Telgmann, *Einleitung zu der Geschichte der Römischen Rechts-Gelehrsamkeit, von Scheidemantel* (2 Theile. Leipz. 1780).

Jo. Aug. Hellfeld, *Historia Juris Romani* (Jen. and Lips. 1740).

Udalr. Oetti, *Historia Juris Civilis* (Styr. 1769).

Jo. Ant. Riegger, *Historia Juris Romani Privati potissimum* (Frib. Brig. 1770).

Reitemeier, *Encyclopädie und Geschichte der Rechte in Deutschland* (Gött. 1785).

Hufeland, *Lehrbuch der Geschichte und Encyclopädie aller in Deutschland geltende Rechte* (Jena, 1798).

The first part of this unfinished work contains an introduction to the history of Roman law.

We may here remark that the word *Encyclopädie* conveys very different notions to German and to English ears. To the German, *Juristische Encyclopädie* means an introduction to the study of law, containing general outlines and *præcognoscenda*, and is either formal, confining itself to method and nomenclature, or material, giving a cursory view of the contents of law, or both formal and material.

Jos. Tosc. Mandatoritii, *Juris Publici Romani Arcana* (tom. v. Neap. 1767—80).

J. H. C. de Selchow, *Elementa Juris Romani Ant Justiniani* (Gött. 1778).

C. A. Güntheri, *Historia Juris Romani* (Helmst. 1798).

A. Hummel, *Handbuch der Rechts-Geschichte* (3 Bände, Giessen, 1805).

Th. Max. Zachariæ, *Versuch einer Geschichte des Röm. Rechts* (Breslau, 1814). The author of this work is not to be confounded with C. S. Zachariæ, who has written a curious tract *De Originibus Juris Romani ex Jure Germanico repetundis* (Heidelberg, 1817).

C. A. Gründler, *Handbuch der Rechts-Geschichte* (1er Band, Bamb. 1821. Unfinished, 1842).

W. Rein, *Das Römische Privat-Recht, &c.* (Leipz. 1836).

Ch. Ch. Dabelow, *Römische Staats- und Rechts-Geschichte im Grundrisse* (Halle, 1817).

Lud. Pernice, *Geschichte, &c. des Röm. Rechts im Grundrisse* (Halle, 1823).

H. R. Stockhardt, *Tafeln der Geschichte des Röm. Rechts* (Leipz. 1828).

Christiansen, *Die Wissenschaft der Röm. Rechts-Geschichte im Grundrisse* (1er Band, Altona, 1838. Unfinished).

The author is a disciple of the philosophy of Hegel.

Danz, *Lehrbuch der Geschichte des Röm. Rechts* (1er Theil. Leipz. 1840. Unfinished).

Ch. Giraud, *Introduction Historique aux Eléments de Droit Romain de Heineccius* (Paris et Aix, 1835).

Guérard, *Essai sur l'Histoire du Droit Privé des Romains* (Paris, 1841).

Burchardi, *Staats- und Rechts-Geschichte der Römer* (Stuttgart, 1841).

This book contains much in a small compass.

Geib, *Geschichte des Römischen Criminal-Processes* (Leipz. 1842).

This interesting and elaborate treatise, though we often see cause to differ from its results, merits the praise of originality, and supplies an important desideratum in the history of Roman law.

An account of some of the works above mentioned

may be found in Dr. Irving's *Introduction, &c.* A complete list has not been attempted. Some of the omissions of modern names may be supplied by referring to Engelmann's edition of the *Bibliotheca Juridica* (Leipz. 1840). See the head *Römisches Recht* in the index, p. 581. Where there are several editions of the same work, the latest has usually been mentioned, and the titles have been abridged. There are excellent chronological tables of Roman law, forming the greater part of what is called the second volume of Haubold's *Institutionum Juris Romani Privati Historico-dogmaticarum Lineamenta*, as edited after the author's death, by D. C. E. Otto (Lips. 1826).

In none either of the French or English works which we have named can the reader expect to find any very detailed and satisfactory account of the views which have been disclosed by the recent discovery of additional sources, or by diligent research into the old authorities. In the successful cultivation of Roman law the Germans at this day take precedence of every other nation. Some of the modern speculations are important in themselves; some have been raised to importance by temporary fashion, to the comparative neglect of investigations which in the preceding generation were in vogue. In some of the modern German manuals, a student would be disposed to remark a certain dogmatism or pedantry in the mode of statement, and a want of subordination and symmetry in the composition. Minute points and doubtful conclusions are dwelt upon at undue length, as if they were certain, and not, after all, insignificant.

The reader who desires to make himself master of the progress of modern speculation will find great assistance from some of the continental journals and reviews of jurisprudence, which have been made the organs of literary party, and have received contributions from the ablest civilians of the day. The most celebrated of these for their illustration of the history of Roman law are,—

Hugo's *Civilistisches Magazin* (7 Bde, Berlin). This magazine was commenced in 1791, and some of the early volumes have been several times reprinted.

Zeitschrift für geschichtlichen Rechts-Wissenschaft, von T. C. Von Savigny, &c. (Berlin). This journal is now edited by A. A. F. Rudorff, and has reached the 11th volume.

K. Von Grolman's *Magazin für Rechts-Wissenschaft*, continued by Von Löhr (4 Bde, Giessen, 1800—25).

Rheinisches Museum für Jurisprudenz (7 Bde, 1827—1834). Up to 1830 inclusive, this journal was published at Bonn. It subsequently appeared at Göttingen.

Thémis, ou Bibliothèque du Jurisconsulte (10 tom. Paris, 1819—29). Complete copies of this valuable review are now scarce.

The *Kritische Zeitschrift, &c.* published at Heidelberg under the editorship of Mittermaier and Zachariæ, and Fœlix's *Revue de Législation Française et étrangère*, occasionally advert to modern works on Roman law.

The historical cultivation of the Roman law received its first great impulse in modern times from Hugo, and this impulse was most ably enforced by Haubold and Savigny. The sound learning and critical judgment of A. W. Cramer gave him high authority with the most distinguished scholars of his day, though his published works on historical subjects were not voluminous. In the history of Græco-Roman law, Biener, the two brothers Heimbach, and the younger Zachariæ, occupy the

Law.

Superiority of the modern Germans in the cultivation of Roman law.

Journals and reviews.

Names of modern writers eminent for their historical researches in Roman law.

Law.

first rank amongst the moderns; in the study of the most ancient documents of Roman law, Dirksen. The new sources recently discovered have employed a host of professional *savans*, and stimulated the zeal of historical research. Among the names which, in this pursuit, have ornamented the present century may be enumerated Schrader, Von Löhr, Erb, Unterholzner, Goeschen, Clossius, Wenck, Beck, Otto, Bethmann-Hollweg, Böcking, Hasse, Blume, Puggäus, Witte, Buchholz, Barkow, Klenze, Heffter, Francke, Schilling, Keller, Haenel, Huschke, Sell. To these we might add many a "*fortem Gyam, fortemque Cloanthum*."

In exciting such remarkable activity, the spirit of party had no small influence. The spirit of party, arising from the controversy between Savigny and Thibaut on the expediency of introducing a general code into the states of Germany, soon after the year 1814, divided the continental jurists into the philosophical* school, followers of the latter, and the historical school, disciples of the former. The collision of opinions kindled excessive ardour on both sides, and for some time there seemed to be danger of a divorce between philosophy and history. Thibaut thought that sound principle was better than precedent, science than erudition, good laws than ancient customs. The philosophic Thibaut, honoured and lamented, has been carried to the grave, and no one now is readier than the illustrious Savigny to admit that history and philosophy ought to go hand in hand:

*Alterius sic
Altera poscit opem res, et conjurat amice.*

Notice of
elementary
works on
Roman
law

The number of elementary works on the imperial law of Rome is even greater than the number of historical treatises. The ancient course of instruction was confined rigidly to the elucidation of the original text of Justinian's collections by notes or glosses. This plan was gradually abandoned in the 17th Century; but still the best academic manuals, if they did not assume the shape of continuous commentaries or lectures on portions of the *Corpus Juris Civilis* (as was sometimes the case), ordinarily followed the arrangement of the *Institutes* or *Pandects*.

A course of instruction upon the *Institutes* usually presented a general survey of the science, while a second course upon the *Pandects* necessarily descended more into practical details. We have favourable examples of these later modes of teaching in the *Prælectiones* of Huberus, the excellent *Recitationes* of Heineccius, the two *Elementa Juris* of the same author (one *secundum ordinem Institutionum*, the other *secundum ordinem Pandectarum*), and the two *Principia Juris* of Westenberg.

Towards the end of the last century, elementary writers began very commonly, in explaining the law of the *Institutes* or *Pandects*, to adopt arrangements of their own; and this mode of teaching was called the *systematic*, to distinguish it from the former, which was called the *legal*.

Recourse to the systematic plan was rendered expedient from the old method not being in itself sufficiently scientific. Though the arrangement of the *Institutes* was more scientific than that of the *Pandects*, neither arrangement was well adapted to a course of

* The principal periodical publication, which served as an organ of the philosophical party, is the *Archiv für die Civilistische Praxis*, published at Heidelberg. It has reached (1842) 22 volumes.

instruction in those developments of the civil law which were most important in modern practice. The advantages of the change which admitted the adoption of arbitrary system were found to counterbalance the facility of reference, the power of easily comparing and estimating different treatises, and the authoritative catholicity, which were the recommendations of the older method.

Many elementary works combine the *history* of doctrines, with exegetical and dogmatical information; and thus some good works,—as, for example, those of Rein and Pernice,—which we have classed among the historical treatises, might as well have been reserved for mention here. On the other hand, many elementary works confine themselves to the dogmatical illustration of such parts of the civil law as are of practical use at the present day.

It is not unusual for a German professor to publish *Outlines* (*Grundrisse*), with references to authorities, for the use of students attending his lectures, and, after some years, to transform the lectures themselves into a detailed elementary treatise. From the general plan of teaching by lectures in the German universities,—and of teaching not only those branches of knowledge which serve to discipline the mind, but those which are actually employed in the business and professions of mature life,—there arises a closer connection than with us between academic education and the general supply of literary productions. This remark is necessary to enable Englishmen to appreciate the character of many German law-books.

To begin with German elementary works: there are valuable outlines by Heise, Burchardi, Gans, Blume, and Goeschen. German elementary works.

The most eminent scholars have not disdained to compose manuals for beginners. Haubold's *Doctrinae Pandectarum Lineamenta* has not been reprinted since it first appeared in 1820. Hugo's *Lehrbuch des heutigen Römischen Rechts*, which forms the fourth volume of his course of civil law, reached a seventh edition in 1826.

Of the highest order of merit is the condensed and profound *System des Pandekten-Rechts* (8te Ausg. Jena, 1834) of the late celebrated Thibaut. The second volume of the legal remains of the same author has been recently (1842) published at Berlin under the title *Lehrbuch der Geschichte und Institutionen des Römischen Rechts: Hermeneutik und Kritik des Römischen Rechts*. It is a concise and masterly production. More discursive and more fully unfolded in its various parts is the admirable *System des heutigen Römischen Rechts*, which presents the matured production of a long life of study, guided by the sound judgment and illumined by the penetrating intellect of Savigny.

In the choice of riches it is difficult to know whom to mention, and in what order.

The practical elementary treatise which has had the largest circulation is that of Mackeldey, *Lehrbuch des heutigen Römischen Rechts* (11te Ausg. Giessen, 1838). The eleventh edition, published after the author's death, has the advantage of K. F. Rosshirt's remarks and additions. The tenth has been badly translated into French by Jules Beving, of Brussels; and there are other translations into most of the modern European languages.

Almost equally popular is Mühlenbruch's manual, published in Latin under the name *Doctrina Pandectarum* and in German under the name *Lehrbuch des*

Law.

Law.

Pandekten-Rechts. The last genuine editions bear date Halle, 1838. There are Brussels reprints; and a separate collection has been made, by way of supplement, containing at length all the authorities referred to in the work.

Warnkœnig's *Commentarii Juris Romani Privati* (3 vols.; Liege, 1825), and his shorter *Institutiones Juris Romani Privati* (3tia editio; Bonn, 1834) unite the clear and pleasing writing of the French school with a fair share of that erudition which distinguishes the Germans.

Wening-Ingenheim's *Lehrbuch des gemeinen Civil-Rechtes* is a work of long-established reputation. It follows the outline of Heise; and the fifth edition, in three volumes (München, 1838), was revised by J. A. Fritz.

Schweppé's *Römisches Privat-Recht in seiner heutigen Anwendung* (5 Bände; 4te Ausgabe; Göttingen, 1828-1833.) The last three volumes were prepared for publication after the death of the author by W. Meier.

An improved edition (the second) of Marezoll's succinct *Lehrbuch der Institutionen des Römischen Rechts* came out at Leipzig in 1841. A manual for students by Boecking, of Bonn, has recently been published (1842.) Schilling's *Lehrbuch der Institutionen und Geschichte des Römischen Privat-Rechts* (unfinished, 1842) combines institutional with historical information. It enters elaborately into useful details, and exhibits rare accuracy and industry.

Lang, J. J., *Lehrbuch des Justinianisch-Römischen Rechts* (2te Ausgabe; Stuttgart, 1837.)

The posthumous lectures, published at Göttingen, of Goeschen on the civil law, do not belie the reputation of their late distinguished author. Von Vangerow's *Leitfaden für Pandekten-Vorlesungen* (Marburg, 1839, &c.) are said to be worthy of Thibaut's successor; and Kierulff's *Theorie des gemeinen Civil-Rechts* (Altona, 1839) has acquired a high character.

Haensel's *Lehrbuch der Institutionen des Rechts* (Leipz. 1842) promises well. The learned Puchta, whose excellent *Lehrbuch der Pandekten* (Leipz. 1838) is only one of his many important contributions to Roman jurisprudence, has given, in his *Cursus der Institutionen* (Leipz. 1842), a systematic course, historical and dogmatical, which, like Savigny's, traverses all the principal departments of the civil law.

We have mentioned no work which does not possess considerable merit. Probably several good books have been omitted from sheer ignorance; and certainly not a few inferior productions have been designedly passed over. The dates given in the preceding list will show how great has been the recent activity of publication.

Few works, if any, of civil law are better known to English readers than Domat's valuable arrangement, translated by Dr. Strahan. Since Pothier's labours on the *Pandects*, several publications on separate heads of Roman law have appeared in France. In particular, the law of possession has received culture, in consequence of the impulse given to the study of it throughout Europe by Savigny's finished treatise on the *Recht des Besizes*. In this department, M. Pellat's recent work demands honourable notice. The elucidation of the sources has not been neglected; and if the active spirit of research which immediately followed the discovery of Gaius has been somewhat diverted to feudal jurisprudence and the development of the existing legal system, the pursuit of the civil law still obtains a reasonable amount of patronage from the countrymen of

Cujas. Of modern French elementary writers we shall now name but two.

The *Chrestomathie* of Professor Blondeau (Paris, 1830) contains an excellent choice of texts for an elementary course, and there is much good sense in the author's remarks. Difficulties which would be slurred by a less logical and clear thinker are not disguised, and, even in cases where more complete solutions might have been given, the attention of the student is well directed to interesting objects of inquiry.

To the first volume of Ortolan's *Explication Historique des Instituts* (2me edition; Paris, 1840) is prefixed an introduction of about 100 pages, entitled *Généralisation du Droit Romain*. In these pages is manifested all the sparkling vivacity of which many French authors are so fond. The pointed enunciation of abstract propositions,—the bold induction of general principles,—the wide views lucidly presented within the compass of a few pages,—the happy command of metaphysical language—give to this introduction greater attractions than are due to the profoundness of its learning or the minute correctness of all its statements. Readers who look with suspicion on the dashing generalizations,—the sacrifice of laborious research and detailed fact to (so called) philosophical ideas,—the abandonment of sober criticism in search of epigrammatic and antithetical turns of expression—which are common in Lermnier, Michelet, and others of the school of writers to which Ortolan belongs, will scarcely be disposed to give him credit for that modicum of learning and correctness which are really displayed in his clever and brilliant performance.

There are few English elementary works on the civil law. This is principally owing to the practical pursuits which engross professional men after their release from the liberal studies of youth, and to the severance of our own from the imperial jurisprudence. In old times, the learned apprentices of the English common law, who had heard of the arbitrary maxims of the *Institutes*,—who were told that the civil law justified torture,—who saw, in an adoption of the Justinianean compilations, an acknowledgment of some extrinsic authority beyond the authority of reason—a stepping-stone to the domination of the Emperor or the Pope,—were loth to spend upon the illustration of a rival system those precious hours which were demanded by the exclusive jealousy of their own. The works of our civilians are not very important. Wood's *Institutes* or Ayliffe's *Pandect of the Civil Law* are now seldom referred to. Dr. Browne's *Compendious View of the Civil Law* (2nd edition, London, 1802) would not satisfy a modern inquirer. The well-arranged *Analysis* of Dr. Halifax (Cambridge, 1836) requires some editor who would not, like Dr. Geldart, scruple even to mention the name of Gaius.

A complete library of all English books, whether elementary or not, which treat of Roman law, would not be a load for many camels. Who, now-a-days, would consult Fulbeck's *Parallel*, look at Ridley's *View*, or displace from its dusty shelf Wiseman's *Law of Laws*? Some of our writers on ecclesiastical law, as Swinburne and Godolphin,—better casuists and canonists than civilians,—though they often refer to the *Corpus Juris*, seem generally to quote at second-hand. The *Jurisprudentia Philologica* of Eden, and the translation of Justinian's *Institutes* by Harris, are more frequently met with than read. Yet England has pro-

works on
the Civil
Law.

Law.

duced a few names not unregarded nor unvalued by foreign civilians. Of these the most eminent are Selden, Zouch, Duck, and Taylor.

The *Dictionary of Greek and Roman Antiquities* (London, 1842), edited by Dr. W. Smith, contains many very able disquisitions on separate departments of the law and constitution of Rome. It seldom, like the vulgar herd of commentators, dilates unnecessarily on things that are trite and futile; and it generally is honest enough rather to acknowledge than to shirk a felt difficulty. Most of its defects are inseparable from a work published periodically, and having many independent contributors. Hence the discordance of opinion which may sometimes be observed in the treatment of the same subject under different heads. We have occasionally, but more rarely, perceived that a single writer, puzzled between conflicting views, has been content, in different parts of the same article, to make two statements, each probably supported by high authorities, but irreconcilable one with the other. In matters connected with Roman law, the contributions of Mr. George Long will be found safe and consistent. To the Roman lawyer the study of Roman antiquities is essential. The profound antiquary will refer to the ample treasures amassed by Grævius and others, and will acknowledge the surpassing excellence of the classical-minded Italians of the 16th century—men like Manutius, Fulvius Ursinus, and Sigonius, “native there, and to the manner born;”—but the tiro in legal antiquities, in addition to his Heineccius and Adam, Fuss, or Creuzer, will do well to procure Dr. Smith’s *Dictionary*, for, upon the whole, there is no work in the English language from which he would be able to collect so much sound information on Roman jurisprudence anterior to Justinian.

Scotch
modern
writers on
Civil Law.

Scotland—a country more Roman in the Roman, more feudal in the feudal parts of its jurisprudence than England—has given some signs of attention to the Civil Law. Blair’s *Inquiry into the State of Slavery among the Romans* is in some respects a meritorious compilation, but has little pretension to rank high as a legal work; for, though it enters upon legal questions, it altogether overlooks some of the most important technical sources.

Reddie’s *Historical Notices of the Roman Law* (Edinburgh, 1826) is a book that deserves praise for having led the way in furnishing information as to the recent progress of the study in Germany. It does ample justice to Hugo and his followers. It was succeeded by Dr. Irving’s *Introduction*, a work which we have already frequently cited, and from which the student will derive much useful knowledge on bibliographical matters, and will learn some interesting—as well as some trifling—particulars with respect to the private history of modern continental civilians. In some instances, real scholars and men of genius, as Gans, are omitted, or, as Cramer, rapidly dismissed, while minor luminaries, as Maciejowski, occupy a disproportionate space. The author is minutely accurate in names and dates, but sometimes descends to frivolous gossip, and lugs in the result of his literary researches unseasonably. There is a smallness in his original criticisms, and “the legend of Amalfi” is made far too much of as a criterion of scholarship. The account of the materials of Roman law, upon which modern commentators work, is given in the commencement, which is much the best written part of the book.

In the United States of America, the Civil Law is perhaps more generally studied than in this country, but our knowledge of American literature does not enable us to name any original elementary works. Mr. Justice Story is glad to adorn his learned and popular treatises with illustrations drawn from the *Corpus Juris Civilis*. The polite and various reading of Story furnishes a copious repast, which is sweetened by the complacency of the host, and his lavish generosity of praise; but the English lawyer does not expect to discover in his pompous and conventional diction marks of that sharp-edged intellect which touches the true distinction and probes the hollow plausibility;—of that logical precision which tracks the vague or ambiguous phrase wherein error lingers or conscious hesitancy lurks;—of that sound and steady judgment which knows where to reconcile apparently conflicting authorities, and where to choose between them, guiding its choice not by number but by weight;—of that critical acumen which can appreciate intuitive sagacity, and assign to it the superiority over undigested erudition;—of that pure taste which will not, with the most unfastidious latitudinarianism, blend the good and the bad—white wine and red—Mitford, Beames, and Cooper. It is necessary to caution such of the numerous readers of Mr. Justice Story as have not deeply studied the Roman law, against the danger of so far trusting him as to accept his application of its rules and his construction of its language with undoubting confidence. In justification of this caution, we proceed to make two quotations from his celebrated *Commentaries on Equity Jurisprudence*.

Law.
American
works on
Roman
Law.

“The term Interdict was used in the Roman law in three distinct but cognate senses. It was, in the first place, often used to signify the edicts made by the prætor declaratory of his intention to give the remedy in certain cases, chiefly to preserve or to restore possession. And hence such an interdict was called edictal; *edictale, quod prætoris edictis proponitur, ut sciant omnes eâ formâ posse implorari*. Again, it was used to signify his order or decree, applying the remedy in the given case before him; and then it was called decretal; *decretale, quod prætor pro re natâ implorantibus decrevit*. And in the last place, it was used to signify the very remedy sought in the suit commenced under the Prætor’s Edict; and thus it became the denomination of the action itself.” (Vol. II. p. 143, sect. 865; 2nd edition, London reprint. 1839. Citing Livingstone *On the Batture Case*, 5 *Amer. Law Journ.* 271, 272; Brisson, *De Verb. Sig. Interdictum*; Vicat, *Vocab. Interdictum*; Heineccii, *Elem. Pand.* ps. 6, sects. 285, 286; but neither Brisson, Vicat, nor Heineccius gives any sanction to the text.)

To say, as Story in substance says, that the Interdict has *three* (not *four*) kindred meanings;—that it means sometimes, 1st. the Edict by which the Prætor promises to give the remedy; sometimes, 2nd. the order or decree applying the remedy; sometimes, 3rd. the remedy sought; and sometimes, 4th. the action itself,—is to make a statement which, to those who understand Roman procedure, is absurd, and to those who understand it not must appear so involved and incomprehensible—so pure a specimen of that “true no-meaning” which “puzzles more than wit,”—that one is surprised to find a writer of Mr. Justice Story’s eminence palming such an explanation upon himself and his readers for sense. We may be allowed to con-

Law.

jecture that the crass obscurity of the paragraph we have quoted arises from a grievous misunderstanding of a division which Oldendorp* supposed to exist, of interdicts into two kinds, analagous to the division of *bonorum possessio* into *edictalis* and *decretalis*, according to the different modes in which such possession was obtained. The forms of certain interdicts applicable to given circumstances were contained in the Prætor's Edict. According to Oldendorp, the interdicts obtained under circumstances to which the forms in the edict were applicable, were, *interdicta edictalia*. Those interdicts he calls *decretalia* of which there were no precedents in the edict, but which were issued by the prætor upon the exigency of a particular case. An English lawyer may illustrate to himself the difference by thinking of the difference between writs of which there were precedents in the *Registrum Brevium*, and writs *in consimili casu*. We have not been able to find any authority for Oldendorp's division of interdicts. It is probable that no interdict could properly have been granted in a case which did not come within the meaning or spirit of those general terms in which the prætor in his edict promised to give such a remedy to suitors. A decree (*decretum*) was an order formally made in court (l. 9, s. 1, *D. de Officio Proconsulis*, (i. 16)); and, if the analogy of the division of *bonorum possessio* into *decretalis* and *edictalis* were followed† we should be led, according to our interpretation of that division, to assign the name *interdicta decretalia* to those interdicts which could only be obtained by formal decree *pro tribunali*. Such may have been the case with all interdicts positively commanding a party to exhibit or to restore something; for these, as distinguished from prohibitory interdicts, were sometimes called *decreta*. It is not impossible that in some, at least, of the cases particularly defined in the prætor's edict, an interdict might have been obtained as of course, out of court, *de plano, per libelli subscriptionem, sine causæ cognitione*, and that such an interdict might have been called *edictale*.

In thus diverging, for the purpose of explaining the origin of Story's confusion on the meaning of the word interdict, we have taken the opportunity of making some statements which will be found of use hereafter, when we come to examine the nature of the prætor's jurisdiction.

The following example of incorrectness is scarcely less glaring.

Mr. Justice Story,—after asserting that an English Court of Equity, when the true owner of an estate can recover it at law, will give no relief, unless there was some fraud on the part of the owner, to a *bonâ fide* possessor on account of the money he may have expended in repairs and improvements,—goes on thus:—

"The Civil Law appears to have proceeded on a far broader principle of natural justice. For, by that law, any *bonâ fide* possessor, as for instance a creditor,

* Oldendorp, cited in *Calvini Lexicon Juridicum*, tit. *Interdictum*, was, we believe, the author of the Latin words inserted in Story's text,—words which, from their strange inapplicability, must have astonished the surrounding English.

† See l. 3, § 8, *D. de Bon. Poss.* (xxxvii. 1); l. 2, § 1, *D. Quis Ordo in Poss. servetur* (xxxviii. 15); l. 3, § 4, *D. de Carbon. Edict.* (xxxvii. 10); l. 1, § 4, *D. Si Tab. Testam. null.* (xxxviii. 6); l. 14, § 1, *D. de B. P. cont. Tab.* (xxxvii. 4); l. 1, § 7, *D. de Successorio Edicto.* (xxxviii. 9).

Law.

who had laid out money in preserving, repairing, or substantially improving an estate, was allowed a privilege or lien for such meliorations. *Creditor, qui ob restitutionem ædificiorum crediderit; in pecuniam quam crediderit privilegium exigendi habebit* (Dig. lib. xii. tit. 1, l. 25; 1 Domat, b. iii. tit. 1, sec. 5, art. 6, 7). *Pignus insulæ, creditori datum, qui pecuniam ob restitutionem ædificii extruendi mutuam dedit, ad eum quoque pertinebit, qui redemptori, domino mandante, nummos ministravit*, (Dig. lib. xx. tit. 2, l. 1; 1 Domat, b. iii. tit. 1, sec. 5, art. 5, 6, 7.)" (2 Story, *Eq. Jur.* p. 454, sec. 1239.)

Now, the cases adverted to in these citations, made through Domat from the *Pandects*, are quite inapposite to the proposition for the proof of which they are quoted. That a man who has lent money expressly for the purpose of rebuilding a house should have a priority of charge over other creditors upon that house, when rebuilt with his money, to the amount of the sum so lent and so expended, does not prove that a *bonâ fide* possessor, expending money upon his own account in building upon ground which, without his knowledge, belongs to another, is entitled to reimbursement as against the rightful owner to the amount either of the actual sum expended, or of the increased value imparted to the land. The creditor in Dig. lib. xii. tit. 1, l. 5, is not a *bonâ fide* possessor,—is not, in fact, a possessor at all. The second passage, cited from Dig. lib. xx. tit. 2, l. 1, is equally inapplicable. It means that a man who pays the builder by the direction of the owner for rebuilding a house, is as much entitled to a tacit charge upon that house as if he had lent the money in the first instance to the owner in order to rebuild it. Here is nothing like a lien for the benefit of a *bonâ fide* possessor making improvements without any legal compulsion on the one hand, and without the sanction or default of the legal owner on the other. Here, again, the creditor is not in the situation of a possessor at all. The following texts would have been more serviceable to the learned commentator:—§ 30, *J. de Rerum Divisione* (ii. 1); l. 33, *D. de Condict. Indeb.* (xii. 6); l. 14, *D. de Doli mali et Metûs Exc.* (xlv. 4). They prove that a *bonâ fide* possessor had the means of making his claim for *impensæ* available against the true owner by refusing to give up possession until he was indemnified; but that he lost all remedy whatever if, before his expenses were paid, the true owner obtained just possession.

English, as well as American, lawyers are so much indebted to the excellent tendencies of this accomplished judge, who has contributed greatly to liberalize his profession, by choosing worthy subjects of investigation, and treating them in no narrow spirit;—so much deference is paid to his authority in parts of the law not frequently traversed by the mere *leguleius*—the class of men to whom "*omne ignotum pro magnifico est*" is so numerous,—and there is so much danger of the baser ore gaining currency along with the genuine metal,—that it is the more necessary, in acknowledging the high merits of Story, to give due warning of his deficiencies and errors.

It would be impossible, without occupying a disproportionate space, to enumerate the best writers on the most important heads of Roman law. The following modern works are considered classical:—

Savigny, *Das Recht des Besitzes* (6th edition; Gies-sen, 1837).

Writers on the single heads of the Roman Law.

Law.

Hasse, *Die Culpa des Römischen Rechts* (2nd edition; Bonn, 1838).

Mühlenbruch, *Die Lehre von der Cession der Forderungs-Rechte* (3rd edition; Griefswalde, 1839).

Hasse, on *Dos* (unfinished); Puchta, on *Customary Law* (*Gewohnheitsrecht*); Keller, on *Litis Contestatio*; Unterholzner, on *Prescription* (*Verjährungslehre*); Marezoll, on *Civil Reputation* (*Bürgerliche Ehre*); and M. S. Mayer, on *Successions* (*Erbrecht*), rank high among the modern works illustrative of Roman law.

Some of the leading commentators on the sources will be mentioned in their proper place. As a specimen of select bibliography and biography, Haubold's *Institutiones Juris Romani Literariæ* (Leipz. 1809), so far as it extends, displays the soundest judgment and learning. The same author's *Institutionum Juris Romani Privati Historico-dogmaticarum Lineamenta*, edited by D. C. E. Otto (Leipz. 1826), deserves the highest commendation for its comprehensive and methodical distribution of subjects, accompanied by ample references to the ablest commentaries and disquisitions. Hugo's *Civilistische Bucherkentniss* (2 Bände; Berlin, 1828-9) is also a classical production. *Struvii Bibliotheca Juris Selecta*, edited by Buder (Jena, 1756), and Camus's *Bibliothèque Choisie des Livres de Droit*, appended to the *Profession d'Avocat*, and edited by Dupin, *aîné*, are useful works, and common in English libraries.

A fuller list of modern books is given in Ersch's *Literatur der Jurisprudenz, &c. seit 1750* (Leipz. 1823); but the most complete legal bibliography is contained in the *Bibliotheca Realis Juridica* of Lipenius, with its modern supplements.

For a detailed history of the cultivation of the Roman law in the middle ages, the famous work of Savigny (*Geschichte der Römischen Rechts im Mittelalter*; * 6 Bände; Heidelberg, 1826-1831) may almost be said to supersede all others. The work is mutilated in the feeble French version of Guénoux, but the first volume has been well translated into English by Cathcart.

In giving a general account of the progress of law at the commencement of this Article, we have shown how different countries in Europe have successively acquired pre-eminence in the cultivation of Roman Law, and have mentioned the names of some of its most distinguished votaries. English civilians have principally adhered to authors of the Dutch school, partly because of the former intimacy of our commercial intercourse with the Low Countries, partly because the Dutch commentators usually followed the laudable practice (almost deserted by their German successors) of writing in Latin, and partly because of the intrinsic and enduring excellence of their practical works.

It is almost superfluous to state, that even a moderate acquaintance with Roman law cannot be acquired without the study of general Roman history and Latin philology. Greek must be mastered by the deeper proficient; and, of modern languages, German affords the greatest help.

Works relating to the general history of Rome.

The English student of Roman law will peruse the historical works of Adam Ferguson, Malden (*Library of Useful Knowledge—History of Rome*), and Arnold, some of whose valuable contributions adorn this Encyclopædia. The whole of Niebuhr's *History* is now added to English literature. We also possess the brief

Manual of Heeren. The inquiries of Wachsmuth into the most ancient times of Rome (*Die ältere Geschichte des Römischen Staates*, Halle, 1818) deserve translation, proceeding as they do from the ablest of Niebuhr's opponents.

Among the recent German contributions to the constitutional history of Rome are the following works:—

K. D. Hüllmann, *Römische Grundverfassung* (Bonn, 1832).

Rubino, *Untersuchungen über die Römische Verfassung und Geschichte* (1er Band; Cassel, 1839). These researches are highly interesting and important.

Huschke, *Die Verfassung des Königs Servius Tullius* (Heidelberg, 1838).

K. W. Goettling, *Geschichte der Römischen Staats-Verfassung bis zu C. Cæsar's Tod.* (Halle, 1840). Very little reliance is to be placed upon Goettling's critical judgment or logical faculties.

Peter (Carl, Dr.), *Die Epochen der Verfassungsgeschichte des Römischen Republik* (Leipz. 1842).

For the interpretation of the technical terms of Roman law, the student could scarcely require a better guide than the admirable *Latin Dictionary* of Facciolati, himself no mean civilian. Some additional help, however, may be obtained from the work of B. Brissonius, *De Verborum Significatione*, edited by Heineccius and Boehmer (Halle, 1743); to which may be joined the *Addimenta* of J. Wunderlich (Hamburg, 1778), and the *Supplementum* of the deeply-learned A. G. Cramer (Kiel, 1815). Few books can be named more useful than the treatise *De Formulæ et Solemnibus Populi Romani Verbis* of the same Brissonius, edited by Bach (Leipz. 1754). The *Vocabularium Utriusque Juris* of Vicat, though it contains little that is original, is highly esteemed in this country. The *Clavis Ciceroniana* of Ernesti is in every one's hands. It often usefully explains laws and legal phrases, but the author occasionally betrays a want of familiarity with technical language. Thus,—to give an example pointed out by Hugo (*Röm. Rechts-Gesch.* 195),—he interprets the expression “*Χρήσει μὲν tuus, κτήσει δὲ Attici nostri*” (*Cic. ad Fam. vii. 29*), by the words “*usu quidem tuus, possessione autem Attici*” (*Ern. Clav. verb. Χρήσει*). A lawyer would have remembered the line, “*Vita mancipio nulli datur, omnibus usu,*” and would never have thought of translating κτήσει by *possessione*. The *Promptuarium* of Elvers (Göttingen, 1824) may be referred to in reading Gaius and Ulpian. The *Manuale Latinitatis Fontium Juris Civilis Romanorum, in usum tironum*, by H. E. Dirksen (Berlin, 1837), though it is the production of a well-read scholar and sound lawyer, does not supersede the older work of Brissonius. It may sometimes be necessary to refer to the invaluable *Glossarium mediæ et infimæ Latinitatis* of Ducange, of which there is an octavo abridgment by Adelung.

For the interpretation of the terms occurring in Græco-Roman law, may be consulted Ducange's *Glossarium mediæ et infimæ Græcitalis*, the Glossaries of Jac. Godefroi to the *Codex Theodosianus* and to *Harmenopulus* (the latter, with additions by Reitz, has been inserted in the Supplement to Meerman's *Thesaurus Juris Civilis*); Reitz's Glossary to Theophilus; and the *Glossæ Nomicæ*, edited by Labbe.

The collection of Latin Inscriptions by Orelli, and the numismatic works of Spanheim, Eckhel, Mionnet, and Rasch, will occasionally be found of assistance to the historical investigator of Roman Law.

Law.

* A second edition of the first three volumes appeared in 1834.

Law.

Sect. 4. *On the Original Authorities for the Materials of Roman Law.*Original
authorities
for the ma-
terials of
Roman
law.

From the preceding imperfect indication of some of those modern writers who have treated of the law of Rome, we pass to a statement of the authorities from which their materials are taken.

These authorities are of two kinds, untechnical and technical.

The untechnical authorities consist of those notices which unprofessional writers, historians, orators, philosophers, grammarians, poets, &c., have left to us in relation to the laws of Rome. With respect to the untechnical authorities, much reliance is not to be placed upon their accuracy in the incidental mention of legal subjects. It is not safe, for example, to draw a positive inference from the legal phraseology sometimes put, by way of joke, into the mouths of his characters by Plautus. A lawyer's eye may now and then detect legal inaccuracies in the classics. Thus Horace, who is vulgarly believed to have been a cordial hater of lawyers, speaks of the prætor taking away from a spendthrift the disposal of his property, and committing the *tutela* to his sane relations—(*Sat. lib. ii, sat. 3, l. 218*)—

Interdicto huic omne adimat jus
Prætor, et ad sanos abeat tutela propinquos.

The more technical word here would have been *cura*, though *tutela*, even in legal writers, is sometimes used as a generic word, comprising the *cura* as well as the *tutela* strictly so called. The inaccuracy is, therefore, scarcely so great as would be that of an Englishman who should speak of the *guardian*, in place of the *committee*, of a lunatic. Again, Livy several times (*e. g. xxxix. 9*) uses the word *manus*, which technically denotes the peculiar authority of the husband over the wife, in a much more general acceptance. In estimating the constitutional and legal information given by historians, it is necessary to trace the causes likely to lead them into a biased narrative,—to examine whether they are credulous,—whether they desire to make their accounts interesting by anecdotes, however apocryphal,—whether they accommodate the institutions of Rome to those of their own country,—whether they espouse a party, or have a theory to support. In reading the speech of an orator in defence of a client, it must be recollected that considerable liberty was taken in mis-stating the law for the purpose of gaining the cause, or winning the applause of the audience. Not seldom, to use the words of Cicero,—(*2 de Fin. c. 22, extr.*) “*à iudicibus oratio avertitur: vox in coronam, turbamque effunditur.*” Cicero acknowledges this of himself. (*4 de Fin. 27*).

Untechnical
authorities.

There are scarcely any of the Roman classical writers from whom the industry of civilians has not derived some inference or elicited some illustration.

Of all the Roman writers not strictly professional, or not writing professionally, Cicero, the advocate, the augur, the prætor—we will not add,* the juriconsult—furnishes the largest fund of information upon Roman law and antiquities. His *Topica*, addressed to the jurist Trebatius Testa, is a treatise abounding in

legal explication. The treatises *de Officiis*, *de Legibus*, *de Oratore*, and *de Republica*, are important to the civilian. His other writings on philosophy and rhetoric, and his private letters, are rich in legal allusions. His speeches to a *judex*, to the senate, or to the *populus*, throw light upon many obscure points of practice and procedure. The fragments of speeches recently discovered by Mai, Niebuhr, and Peyron, were edited separately by Engelbronner in 1830.

Next to Cicero, perhaps Aulus Gellius is the unprofessional writer most valuable to the student of Roman law. In his amusing miscellany, the *Noctes Atticæ*, are preserved legal forms, antiquarian information connected with legal history, and fragments of ancient juriconsults. The rhetoricians, M. Annæus Seneca, Julius Victor, and especially Quinctilian, contain many passages relating to Roman law. The *Scriptores Linguae Latinæ*,—especially *Ter. Varro, Verrius Flaccus, Festus, Nonius Marcellus, Fulgentius Plantiades, and Isidore,—to whom may be added Priscian,—abound in explanations of juridical terms. Festus, in particular, preserves many curious notices of legal history. Along with these may be mentioned the Greek grammarian Dositheus Magister, and the lexicographer Suidas. Of the poets, Virgil and Ovid were manifestly well versed in legal antiquities, especially in matters connected with religion. The scholiasts, Asconius and Boethius, in their commentaries on Cicero, Donatus on Terence, Servius on Virgil, Acron and Porphyrio on Horace, are often serviceable to the jurist. The *Scriptores Rei Rusticæ*, especially M. Porc. Cato, Ter. Varro (before mentioned as a grammarian), and Columella, throw occasional light upon the forms of rustic contracts and other portions of the law. More important are the *Agrimensores*, or *Scriptores Rei Agrariæ*—a class very distinct from the preceding. They often illustrate the law of boundaries, the rights of neighbouring proprietors, and the nature of *possession*, legally and historically considered. The study of them led Niebuhr to those researches which produced his Roman history. Under this class of writers are comprehended Frontinus and his commentator Aggenus Urbicus, Siculus Flaccus, and Hygenus.† Frontinus, who lived under Domitian, and wrote, among other treatises, a treatise upon the stratagems of war, possessed very accurate legal knowledge, and is not to be confounded (as has sometimes been done) with that Fronto, a contemporary of Antoninus, whose letter and orations, recently brought to light by Mai, are but of little use in illustrating the political institutions of his day. The constitution of the Roman army—a difficult and perplexing subject—is closely connected with the civil constitution of early Rome; and we venture, without examination, to suggest a doubt whether the external historians of Roman law have sufficiently pressed into their service the *Scriptores Rei Militaris*. Some of the fathers of the Church, especially Tertullian, Lactantius, Justin Martyr, and Augustine, have yielded to lawyers good store of materials. Lucius Annæus Seneca, the philosopher,—the two Plinies, especially the naturalist,—Aurelius

Law.

* There has been much dispute whether Cicero was a juriconsult, and high modern authorities decide in the affirmative. (See Zimmern, 1 *Röm. R. G.* 289, n. 16.) We hold with Bynkershoek, that he did not consider himself to be one, though he knew that he could be, if he chose. (See *pro Muræna*, 13, and 1 *de Leg. c. 13*.)

* The designations *Scriptores Linguae Latinæ*; *Historiæ Augustæ Scriptores*, &c., are, to some extent, ambiguous. The groups of authors comprised under them by different editors have not been invariable.

† This name, usually written Hyginus, is invariably written as above in the best ancient manuscripts.

Law.

Symmachus (*præfectus urbi* under Theodosius II.),—Macrobius,—Valerius Maximus (a contemporary of Tiberius),—Balbus and L. Volusius Mæcianus, who wrote on weights and measures, the former under Augustus, the latter under the Antonines,—M. Valerius Probus (not the contemporary of Nero, but a later grammarian), who wrote, among other things, on legal abbreviations (*notæ juris*)—the chronologer Censorinus,—the architect Vitruvius, have all been subjected to examination and contribution.

Historians
who have
written in
Latin.

To this miscellaneous assemblage we have postponed the professed historians of Rome, not because they are unimportant, but because they form a considerable class of themselves. "*Il faut éclairer,*" says Montesquieu, "*les lois par l'histoire, et l'histoire par les lois.*" The external historian of law especially must have frequent recourse to general history. Among the authors who have written in Latin, he must occasionally consult Julius Cæsar, Cor. Nepos, Sallust, Velleius Paterculus, and Florus: he must not overlook Aurelius Victor, Eutropius, Sextus Rufus, Ammianus Marcellinus; but his principal attention will be bestowed on Livy, Tacitus, and Suetonius. For the times of the later emperors, he will turn to the *Historiæ Augustæ Scriptores*, under which name may be enumerated Lampridius, Spartianus (who is not improbably the same person with Lampridius), Gallicanus, Trebellius Pollio, Vopiscus, Julius Capitolinus, Cassiodorus. These writers are peculiarly valuable for their elucidation of the political and social institutions of the Empire.

We proceed to the historians who have written in Greek.

Historians
who have
written in
Greek.

Of the early legal history of Rome, Dionysius of Halicarnassus, a careful and learned antiquary, but of no poetic taste or feeling, is a most important source. Polybius, the friend of the Scipios, is very accurate, and abounds in maxims of political wisdom. Notwithstanding the fragments discovered by Mai, his *General History* unfortunately remains very imperfect. The loss of the greater part of the sixth book is severely felt. Some of his observations on the Roman constitution are translated by Cicero in his treatise *de Republica*, Plutarch's most interesting *Lives*, and his *One Hundred and Thirteen Roman Questions*, have much corn which a critical fan may separate from the chaff. He is more at home, however, in the affairs of Greece than in those of Rome. Dion Cassius (called, by the precisely accurate Hugo, Cassius Dio), Diodorus Siculus, and Appian, all begin their histories from the commencement of the Roman state. Dion is continued by Xiphilinus and Zonaras.—Herodian and Zosimus treat exclusively of the time of the emperors. The Byzantine historians contribute largely to legal history. Among these, Procopius of Cæsarea (continued by Agathias and Menander) is especially important for the time of Justinian, though his veracity and fidelity have been called in question from the hostility to his master which is exhibited in his later secret history (*Ἀνέκδοτα*), in striking contrast with the spirit of his former work on Justinian's wars.

The Jewish antiquary, Flavius Josephus, ought not to be omitted; and some of the ecclesiastical historians of the Christian Church, as Eusebius, Theodoretus, Socrates Scholasticus, and Evagrius, illustrate the bearing of the imperial constitutions upon Christianity, and the incipient relationship of the Civil and Canon Laws. Falck, in his *Juristische Encyclopädie*, remarks

(see Pellat's French translation, Paris, 1841, p. 413 n.) that Zirardini, in his *Commentary on the Post-Theodosian Novells* (Faenza, 1776), has availed himself of the Christian martyrologists, for the purpose of elucidating some of the obscurities which still overhang the judicial organization and procedure of the Romans.

A few works remain to be mentioned before we quit the unprofessional authorities.

Joannes Laurentius ("*Laurentii filius?*" Hugo) Lydus, a man without judgment or sound learning, and, like Procopius, a contemporary of Justinian, wrote a work *Concerning Magistrates*, of some consequence to the Roman lawyer, inasmuch as the subject was peculiarly within the province of the author, who was employed in the chancery of the *præfectus prætorio*. The manuscript of this work was first discovered by Villoison, in 1785, in the neighbourhood of Constantinople, and the first printed edition appeared at Paris, in 1812, by Fuss, with a preface by Hase. This, which was long the *only* edition, requires to be completed by the letter of Fuss to Hase, (*Fussii ad Hasium Epistola, in quo Lydi textus et versio emendantur*. Leodii, 1820.) A new edition of the extant works of the Lydian Joannes, including the treatise *Concerning Magistrates*, revised by Bekker, appeared at Bonn in 1837.

In 1829, Huschke published at Breslau (under the title *Incerti auctoris magistratuum et sacerdotiorum populi Romani expositiones*) a dry little work, discovered in manuscript at Paris, and by some modern scholars referred to the end of the fourth century; by others to the beginning of the seventh, or to a still later date.

With these works may be consulted the more full and satisfactory Latin treatise on the same subject, called *Notitia Dignitatum*, which, from internal evidence, appears to have been composed after the death of Honorius (A.D. 425), and before the destruction by Attila (A.D. 452) of *Concordia* and *Aquileia*. It may be found, with the notes of two of its former editors, Pancirolli and Labbe, in *Grævii Thesaurus*, tom. vii., p. 1309, and it has been lately re-edited at Bonn by Boecking. It must not be confounded with the similar work of borrowed title inserted in the last volume of Jac. Godefroi's edition of the *Codex Theodosianus*.

We must also name the *Notitia Provinciarum*, which was first published by Maffei, in the appendix to his *Istoria Teologica*, from a Veronese manuscript; and the *Libellus Provinciarum Romanarum*, which may be found in the *Varia Geographica*, edited by Gronovius. (Lug. Bat. 1739.)

We now proceed to the technical authorities for the materials of Roman law. Technical authorities.

The technical authorities may be divided into two classes:—1st. Private legal documents.—2nd. Legislative enactments and legal works.

Here it is necessary to remark, that the distinction between technical and untechnical is not logically precise. An unprofessional writer, for instance, as Aulus Gellius, is classed as an untechnical authority, while the legislative enactments and other legal documents preserved in his works are, when considered by themselves, ranked among the technical authorities. Moreover, some of the above-named works might as well be classed under a distinct head, as half technical.

The greater part of the private legal documents which have come down to us are contained or referred to in the very interesting collection of Spangenberg, Private legal Documents.

Law.

Law.

entitled *Juris Romani Tabulæ Negotiorum Solemnium, modo in ære, modo in marmore, modo in charta superstites* (Lipsiæ, 1822). Spangenberg's own dissertations, prefixed to the collection, abound in valuable information.—Every lawyer knows how conducive to a right understanding of the law is the study of formal precedents.—The comparison of the modes in which the same objects are effected in different systems of jurisprudence has the advantage of correcting the prejudice into which narrow-minded practitioners not seldom fall, of supposing that the way of transacting business to which they have been accustomed is the only possible or the only rational one. At the same time, the resemblances between wills, conveyances, and other legal proceedings, of different ages and countries, afford curious proof of the force of tradition in such matters, and the extent of servile copyism.—The scribe or conveyancer, looking at an old form, frequently adopted words applicable to a state of law which was become obsolete, or had been altered. In reading the description of the abutments, and the verbose transfer of all the right and interest of the vendor, and of all ways, watercourses, &c., with the appurtenances, in a Roman *venditio*, the lawyer will often be reminded of the style of an English purchase-deed. Few, perhaps, are aware of the antiquity of the form still so common in the commencement of wills, "In the name of God, Amen;" or of the still greater antiquity of the declaration, borrowed probably from the Athenian law, that the testator, though weak in body, is of sound mind and memory. The ancient records of forensic proceedings, and the honourable discharges, usually conferring certain franchises, given to soldiers (*tabulæ honestæ missionis*), are among the most valuable legal monuments we possess. The authorities which we are now treating of are for the most part either contained in Spangenberg's work, or reference is there made to more copious collections, such as Marini's *Papiri Diplomatici*, where they are given at large. Few, we believe, of much importance have been since discovered.

In the year 1820, there was found in the vineyard of St. Amendola, on a part of the Via Appia, which bore evident marks of having been an ancient Roman burying-ground, a marble slab broken into two fragments. On these was an inscription wanting the beginning and end, and presenting, probably, the oldest specimen in existence of a Roman will. The person first named as heir is required, as a condition, to take the name of the testator, which appears to be Dasumius. Among the legatees are mentioned Plinius Secundus and Cornelius Tacitus. The inscription was first published by the advocate Carlo Fea, in 1820, in the *Diario di Roma*, and afterwards in the *Varietà di Notizie*. It was subsequently brought before German scholars by Puggé, in the 1st volume of the *Rheinisches Museum für Jurisprudenz*, p. 249 (Bonn, 1827). A further fragment of the same inscription was discovered at Rome in 1830, and published in the 2nd Part of the *Annali del Istituto di Corrispondenza Archeologica*, 1831.

In 1838, Huschke published for the first time, with a commentary, as an offering on the occasion of Hugo's jubilee from the faculty of law at Breslau, an instrument of donation of one T. Flavius Syntrophus—*T. Flavii Syntrophii instrumentum donationis ineditum edidit et illustravit, &c.* Ph. Ed. Huschke (4to. maj. Vratislaviæ, 1838). This instrument, which was dis-

covered by Ritschel at Rome in 1837, in a manuscript collection of inscriptions, contains a gift, by Syntrophus, of a piece of land to one of his freedmen in trust for himself and the other freedmen, present or to come, of the donor. The trust is enforced by a *pænæ stipulatio*. Then follow the *mancipatio*, with the assistance of an *antestatus*, and the *traditio*. An English conveyancer would compare the donation to a deed of feoffment with livery of seisin endorsed. In a *Mémoire* by Warnkœnig, on the progress of the Science of Law in Germany since 1815, in the 8th Volume of Fœlix's *Revue de Législation* (January, 1841), the will of Dasumius, first published by Fea, is erroneously identified with the *instrumentum donationis* of T. Flavius Syntrophus, first published by Huschke. Warnkœnig (p. 30) enumerates among the recent German contributions to Roman Law "*l'édition des fragmens du testament récemment trouvé de T. Flavius Syntropus* (sic), dans lequel Tacite et Pline sont nommés légataires, donnée par M. Huschke à Breslau, et enrichie d'un Commentaire (1838)."

In the year 1841, J. F. Massmann published at Leipzig an account (*Libellus Aurarius*) of two sets of wax-covered tablets containing inscriptions. The first set was made of three fir boards connected book-wise, so as to afford four internal pages of wax (*triptycha*), and was found in 1790 in a gold mine in the neighbourhood of the village of Abrudbánya, in Transsylvania. The second set, made similarly of beechen boards, and in less perfect condition than the first, was found in 1807 in another gold mine situate within the village itself. In the fir tablets, the wax, hard and blackened by time, is inscribed with a legal document, written in Latin from right to left, and commencing at what we should call the fourth page. It attests, in due form, certain matters connected with a corporation or guild, probably of mining adventurers or workers in gold (*collegium aurariorum*). It is not only interesting in a legal view, but remarkable as containing the oldest specimen in existence of Roman running-hand, strangely preserved. Fortunately the same form of words was written twice, and the difficulty of decyphering was thus considerably diminished. Means of comparing the shape of letters were presented, and the effaced or doubtful writing in one copy of the testation was supplied or explained by the counterpart. The names of the consuls are affixed (*Imp. L. Aur. Ver. III. et Quadrato Cs.*), and thence we are able to assign to the document the date A.D. 168. The contents of the beechen tablets are in an unknown character, supposed to be Dacian, with the exception of the old oracular response (not inappropriate to the place) scribbled in Greek:—

Ἀργυρεαὶς λογχαῖσι μάχου, καὶ πάντα κρατῆσεις.

A detailed description of the fir tablets and their contents may be found in the 28th Volume of the *Foreign Quarterly Review*.

Of the technical authorities, not consisting of legal documents relating to private transactions, but classed by us under the head of legislative enactments and legal works, many are known merely from monumental inscriptions. Of such inscriptions, the most valuable are copied in the posthumous work of Haubold, edited by Spangenberg, and entitled *Antiquitatis Romanæ Monumenta Legalia* (Berolini, 1830). This collection gives the history of the monuments, and also indicates the particular passages of ancient authors which contain legal fragments: it is indispensable to

Law.

Law.

the student of Roman law. A monument of early date (A.U.C. 568), valuable philologically as well as legally, is the *Senatus-consultum de Bacchanalibus*, known to English readers from the commentary upon it appended to Taylor's *Civil Law*. Among the most interesting of the monumental inscriptions is the law concerning Cisalpine Gaul (A.U.C. 705, B.C. 49). The name of this law was detected in a singular manner. It contains a formula which it directs to be used in certain legal proceedings; and this formula, as Puchta was the first to observe, refers to the law ordaining its use by the name *Lex Rubria*. The *Lex Servilia* and the *Lex Thoria*, with a not unusual economy, are engraved on opposite sides of the same bronze tablet. There has been much controversy as to the respective dates of these laws, which may probably be referred to the middle of the seventh century of the city. The recent commentaries of Klenze and Dirksen on the former, and of Rudorff on the latter, have met with high commendation from eminent scholars. The tablet found at Bantia has on one side the *Lex Acilia Repetundarum* (enacted probably between the years of the city 654 and 665), and on the other side a municipal statute in the Oscan language. Our knowledge of the mode of administering justice in Italy and the Provinces, and of the law relating to the *ager publicus*, receives many accessions from these sources. The *Obligatio Prædiorum*, commonly, but not so properly, called *Tabula Alimentaria Trajani*, is a charitable foundation of Trajan (or sanctioned by Trajan), for the support of orphan children. A similar document of Hadrian is stated by Blume (in the 4th volume of the *Rheinisches Museum für Jurisprudenz*) to have been lately discovered at Naples. The *Tabula Heracleensis*, one fragment of which was brought to England in 1735, but in 1760 restored to Naples, contains fragments of several interesting laws supposed to have been enacted between the years of the city 644 and 680, and relating in part to Rome, in part to municipal towns and colonies.* On the opposite side is engraven a Greek psephisma. Two Greek Edicts of Cn. Virgilius Capito and Tib. Julius Alexander, Præfects under Claudius and Galba, were found by F. Cail'aud in 1818, engraven on the portico of a temple in the Great Oasis of Egypt, and were again copied in succession by Mr. Hyde and Sir Archibald Edmonstone, or, as Haubold (*Mon. Leg.* p. 199), by a natural but ludicrous mistake of the contracted title for the name, tells us, "*a duobus Anglis, Hyde et Bart.*" They are given in *Edmonstone's Journey* (London, 1822), with the English translation and notes of Dr. Young, and have since been amply commented upon by Rudorff in the 2nd Volume of the *Rheinisches Museum für Philologie*. They illustrate the public state of Egypt. The *Edictum* of Diocletian (A.D. 303), fixing a maximum price for labour and provisions throughout the Roman Empire ("our world"), is more curious in an economical than a legal view. It was first found and copied by Sherard, the British Consul at Smyrna, in 1709, on a stone at Stratonice (Eski Hassâr). This stone was lately re-discovered by Mr. William Bankes, who made a fac-simile, which is deposited

* The Latin inscription on the *Tabula Heracleensis* is identified by Savigny with the *Lex Julia Municipalis* mentioned by Orelli, *Inscr.* No. 3676, and is referred by him (*9 Zeitschrift*) to A.U.C. 709.

in the British Museum. Another stone, containing (remarkably enough) the beginning of the same edict, with some various readings, was brought from Egypt in 1807, and is now in a private museum at Aix. Mr. Martin Leake's *Essay* upon the Edict of Diocletian may be found in the 1st Volume of the *Transactions of the Royal Society of Literature*. We must not omit the *Lex de Imperio Vespasiani*, which is famous for its bearing on the controversy with respect to the reality of the *Lex Regia*, mentioned in the commencement of Justinian's *Institutes* (§ 6, *I. de Jur. Nat.* (I. 2.)). In concluding this subject, it is proper to remark that great caution is necessary in discriminating between genuine and forged inscriptions. Some very learned antiquaries (*e. g.* Ursinus) have not scrupled to disgrace themselves by literary fabrications, and some of the most valuable of the early collectors (*e. g.* Gruterus) were more industrious than critical.

The legislative enactments and legal works, known, not from monumental inscriptions, but from manuscripts and printed books, may conveniently be classed, according to order of time, into three groups: 1, the Ante-Justinianean; 2, the Justinianean; 3, the Post-Justinianean authorities.

The earliest Ante-Justinianean authorities consist of such remains as we possess of the Laws of the Kings.

In various authors mention is made of particular laws, which are attributed by name to one or other of the kings of Rome, and there have been many attempts to collect all these scattered notices, and to restore the laws to their ancient form and order. Niebuhr thinks that the laws of the kings, as we now have them, are not earlier than the restoration of the city after the invasion of the Gauls. In support of this opinion, two arguments are urged, derived from internal evidence: first, the traces which may be discovered in them of reference to times subsequent to the kings; and, secondly, the Latinity of the fragments cited by Festus and other ancient writers. These, unlike a genuine monument of the earliest times, the hymn of the *fratres Arvales*, are perfectly intelligible, and their language is not more ancient in its form than that of the fifth century of Rome.

These arguments tend to prove, not that the so-called laws of the kings were a subsequent invention, but that their contents had been partially modernized in style, and in some instances corrupted by adaptation to recent events. Similar things have happened in our own legal literature. Our old law-book, called the *Mirror of Justice*, is said by Bradshaw, Attorney-General, in *Reniger v. Fogossa*, Plowden, 8, to have been made before the Conquest. The original stamina of that work belonged probably to the age to which Bradshaw attributes it, but, as we now have it, with later alterations and additions, it cannot be considered as older than the reign of Edw. II.

We may also remark that, without supposing any considerable change to be made in the language of an old law, it might be expected to be more easily understood than the contemporary song of an agricultural brotherhood. The general currency of the metal would prevent its rusting. If Shakspeare had never written, how much more of Shakspeare's language would now be obsolete! A text of Luther's translation of the Bible would appear to a modern German less antiquated than some of the ballads which were sung by rustics in Luther's days.

Law.

Law.

The laws of the kings, as they are to be met in ordinary collections, are not in the state in which they are cited by ancient authors. Collectors and antiquaries, as Ursinus, Joseph Scaliger, and Terrasson, have endeavoured to re-invest them in their ancient weeds. They have rummaged the oldest monuments, the Salian verses, the rostral column, the inscription in honour of Scipio, son of Barbatus, and have set to work to produce an imitation of what Terrasson erroneously calls *Oscan* orthography. To give an example cited in the 5th Volume of the *Thémis*, p. 258, in a review of M. Daunou's *Lecture on the Jus Papirianum*,—Pliny speaking of a law of Numa, says, "*Eadem lege ex imputata vite libari vina Diis nefas statuit, ratione exco-gitata ut putare cogere alios aratores (i. e. those who would otherwise confine themselves to ploughing), et pigri circa pericula arbusi.*" Out of this, Fulvius Ursinus, in his *Notes on Augustinus, de Legibus et Senatus-consultis*, has invented the text, SARPTA. VINIA. NEI. SIET. EX. EAD. VINOM. DIS. LEIBARIER. NEFAS. ESTOD.

Historical objections have been made to the hypothesis that the Royal Laws were preserved, from the defect of evidence with reference to early times and the destruction of monuments consequent upon the Gaulish invasion (compare Liv. vi. 1). We see no reason, however, why they might not have been transmitted either by unwritten tradition, or in the written commentaries of the priests, or the records of private families. We believe with Wachsmuth that the art of writing was known in the earliest days of Rome, and that it was not confined to engraving on wood or bronze, but comprehended the use of a style and waxed tablets, and the painting of coloured letters on boards covered with chalk. A collector of the laws of the kings, named Papirius, is mentioned by Dionysius of Halicarnassus (iii. 36), and Pomponius (l. 2, § 2 *D. de Origine Juris* (i. 2); § 36, *ibid.*). The former speaks of *Caius* Papirius; the latter, with apparent inconsistency, in one section, uses the prænomen Sextus, and in a following section speaks of Publius Papirius. Dionysius says that Papirius collected the *sacred* laws after the expulsion of the kings; Pomponius says that Papirius collected *all* the laws of the kings, and that he was a contemporary of Superbus, who, in the fragment *de Origine Juris*, is erroneously styled "*Demarati Corinthii filius.*" A commentary was written upon the *Jus Papirianum* in the time of Julius Cæsar, by Granius Flaccus (l. 144, *D. de Verb. Sign.* (L. 16)), who entitled his book, or one of his books, *De Indigitamentis*, i. e. concerning invocations or sacred rites, the religious laws of the kings having doubtless remained the longest in use. Indeed, it is probable that Papirius, who was himself a pontiff, directed his attention principally to religious ceremonies, which may be well supposed at the period when he lived to have constituted a large portion of the technical law, and to have been connected with the principal transactions of life.

Servius on *Æneid.* xii. 836, and Macrobius, *Sat.* iii. 17, cite passages from the *Jus Papirianum*, preserved, it may be, in the work of Granius Flaccus; and some of the moderns give the same name to the collections, such as they are, that we now possess of royal laws.

* The word *indigitare*, according to the etymologists, is derived from *indu*, the old form for *in*, and *citare*, signifying to invoke. Modern Latinists usually employ the word in the sense of *pointing out*, as if it was derived from *digitus*.

Law.

Cicero (*de Republica*, ii. 14) speaks of laws of Numa, *quas in monumentis habemus*; and again (V. 2), in reference to Numa, he says, *quæ legum etiam scriptor (not lator) fuisset, quas scitis extare.*

There is a strange story reported by Pliny (xii. 13 or 27). Cassius Hemina, he says,* a most ancient author of annals, states in his fourth book that Cn. Terentius, the scribe, in turning up the soil of his field in the Janiculum, came upon a coffin which had once contained the body of Numa. In the same coffin were Numa's books, of paper (*è chartâ*). Then follow circumstantial details, showing the precautions which had been taken in packing the books, to preserve them from decay.

This took place 535 years from the beginning of Numa's reign, in the consulate of P. Cornelius L. f. Cethegus, and M. Bæbius Q. f. Pamphilus (A.U.C. 573). The books, according to Hemina, contained the philosophical writings of Pythagoras, and, because they were philosophical writings, were burnt by Q. Pætilius, the prætor. L. Piso Censorius agrees with Hemina as to the burning, but reports that seven of the books related to pontifical law, and that there was an equal number of Pythagorean books. Tuditanus says that the books contained the decrees of Numa; Varro and Antius, that there were two pontifical books in Latin, and two philosophical books in Greek. The same thing is told, with several material variations of detail, by Livy (xl. 29), Valerius Maximus, Plutarch, and other authors.

Joannes Lydus, in his work *De Ostentis*, first published by Hase at Paris, in 1823 (a work which contains some curious traditions respecting the book of Tages and the early history of Roman augury), quotes (p. 63), on the authority of Fulvius Nobilior, a remarkable passage from the writings of Numa, to the effect that "the science of the stars (astrology), instead of turning us from religion, leads us to acknowledge the Providence of the Omniscient and Ineffable Father of all things, as manifested in His works, and to observe with admiration that the mind of man, under the governance of God, is able to discourse concerning the things of Heaven."

The remains which we possess of the *Leges Regiæ* are for the most part exactly of the kind which might be expected from the manners and circumstances of the age to which they are referred. Let us take the following examples.

Sei parentem puer verberit, ast oloë plorassit "Parentes," puer diveis parentum sacer esto.

Festus (v. *plorare*) informs us that *plorassit* here means "should call upon."

From Cassius Hemina (referred to in Pliny, xxxii. iii.) and Festus (v. *Pollucere*), Scaliger has just put together the following law of Numa.

Pisceis qui squamosei non sunt, nei polluceto.

Squamosos omneis præter scarum, polluceto.

The object of this law, according to Pliny, was to prevent expensive purchases of fish for the purpose of votive feasts, and to put a stop to the increase of price that would thence be occasioned to persons purchasing for other purposes; for fishes without scales were dearer than most kinds of fish with scales. The scar,

* According to Censorinus, c. 17, Cassius Hemina was alive at the date of the fourth secular games, A.U.C. 607, in the consulate of C. Corn. Lentulus and L. Mummius Achaicus.

Law. it is supposed, was excepted, as being a rare fish (See *Hor. Epod. Ode ii. v. 50*). This reasoning, though ingenious, is not entirely satisfactory. There is an analogous provision in the Mosaic Code.

Marliani pretended to give the laws of Romulus from a tablet found in the Capitol, but the forgery of the *Tabula Marliana* is now generally admitted.

Franc. Balduinus, Charondas, Merula, Lipsius, and others have made collections of the *Leges Regiæ*. One of the most common books in which the fragments may be found, with a commentary, is Gravina's *Origines Juris*.

C. F. Glück wrote an elaborate work on the *Jus Papirianum* (*Liber singularis de Jure Civili Papiriano*, Hal. 1780). Nearly all that is really known of the laws of the kings is contained in Dirksen's *Review* of preceding essays on the criticism and restoration of their text. This review is contained in Dirksen's *Versuche zur Kritik und Auslegung der Quellen des Römischen Rechts* (Leipz. 1823).

Law of the Twelve Tables. We have now to treat of the Laws of the Twelve Tables, and shall first say a few words concerning their origin and history.

The expulsion of the kings was ratified by a *Lex Curiata de Imperio Consulari*, passed on the proposal of Junius Brutus, and called by Pomponius a *tribunian law*, because Junius Brutus at the time was *Tribunus Celerum*. The consuls now succeeded to that jurisdiction which had formerly been exercised by the kings. It is likely that some of the royal laws and regulations went speedily out of use; but that this was the case with all of them, as Pomponius asserts, is at variance with probability, and contrary to facts attested on the better authority of Dionysius, from whom we learn that the collection of Papirius was made after the expulsion of the last Tarquin, and that some of the royal laws were incorporated in the Twelve Tables. If their force as written law ceased, many of them must at least have retained influence as *jus moribus receptum*.

Causes which led to their enactment. There were several co-operating causes which, soon after the establishment of the consular constitution, rendered the *plebs* anxious to obtain a body of revised and written laws. The existing customary laws were scanty, and silent as to many events which required some legal provision. They were partial, and established differences of rights between the patricians and plebeians. The interpretation and application of unwritten laws, labouring under these imperfections, were intrusted to the favoured and dominant caste, who studiously kept them from the knowledge of the many. Under such circumstances, a large discretion was necessarily exerted in the administration of justice; and scope was afforded for its exertion in an arbitrary, unfairly biassed, and oppressive manner. When, in the institution of tribunes of the people, the plebeians found an organ of their will, their disappointment at the ill success of the consular government soon assumed definite form and expression. The perpetual strife between the tribunes and the consuls ended in the proposal of a plan for a review of the laws and constitution, in order to deprive both of their abuses.

Of the causes we have assigned for this result, some have been mentioned by one ancient historian, some by another. The most recent legal writers sometimes adopt one or more of those causes, to the controversial exclusion of the rest. The open or tacit refutation of the errors of contemporaries or predecessors, and the

desire of advancing something new, prevail in the majority of modern continental works in place of that freer movement of spirit which led the older writers to the topics most striking or most important.

Law. In the year of the city 292, the tribune C. Terentillus Arsa proposed a law for the appointment of five plebeians to restrain the consular power within proper limits. The proposition was successfully opposed by the senate, but was renewed by the tribunes in the following year (Dion. Hal. x. 3). The plan seems to have made no outward progress till the year 300, when the tribunes manifested a disposition to concession. In the words of Livy (iii. 31), "*tribuni lenius agere cum patribus: Finem tandem certaminum facerent. Si plebeia leges displicerent, at illi communiter legum latores, et ex plebe et ex patribus, qui utrisque utilia ferrent quæque æquandæ libertatis essent, sinerent creari.*" The patricians required that the legislation should proceed wholly from themselves; but though no decision was come to as to the persons to whom the delegation of legislative power should be made, the first step towards an adjustment was taken. Three deputies, Sp. Postumius Albus, A. Manlius, and P. Sulpicius Camerinus, were sent to Athens with directions to copy the renowned laws of Solon, and to make themselves acquainted with the legal institutions, written and unwritten, of the other states of Greece. This occurrence took place about fifteen years before the Peloponnesian war, in the most brilliant period of the age of Pericles. It was a proceeding perfectly in accordance with the spirit of ancient times, and the practice of most of the celebrated early lawgivers.

Upon the return of the deputies from their mission, in the year 302, the contending parties came to an agreement that the revision of the laws and the constitution should be intrusted to ten patricians, with the title *decemviri legibus scribendis*. These decemvirs were invested with extraordinary powers. The tribunate, the consulship, and all other magistracies, which could in any way impede or obstruct their operations, were suspended, and from their judicial sentence there was to be no appeal. At their head was Appius Claudius, as having been designated consul for the year, and the three deputies formed part of their number.

In those days there dwelt at Rome a philosopher named Hermodorus, a native of Ephesus. Being of good family, and a benefactor to his state, he had obtained the appellation *οὐρίστος*, and had excited by his eminence the jealousy of his fellow-citizens, who, without attempting to deny his merits, determined that he should carry them elsewhere, and banished him, saying, "*ἡμέων μηδὲ εἰς οὐρίστος ἔστω*" (Dion. Laert. in Vita Heraclit.).

Hermodorus probably accompanied the deputies in their mission (though of this there is no record), and was afterwards of so much use to the decemvirs in the accomplishment of their task that a statue to his honour was erected in the forum. Pliny, the naturalist, who mentions the statue, speaks of it in the past tense, as if it were not in existence in his day. With respect to the exact part which Hermodorus took, the accounts transmitted to us and the opinions of the moderns vary. According to some of the moderns, he acted merely as an interpreter, while others suppose him to have been in reality the leading mover in the work of compilation, if not the actual composer of the decemviral laws. The dissidence of modern opinion has

Law. been increased by misconstruction of the classical authorities on the subject. The words of Pliny are, "*legum quas decemviri scribebant interpretes*" (H. N. xxxiv. 5); of Pomponius, "*legum ferendarum auctor*" (l. 2, § 4, D. de O. I. (i. 2)); of Strabo, "*δοκεῖ νόμους τινὰς Ῥωμαίους συγγράψαι*" (xiv. i. 25). It is likely that Hermodorus directed and facilitated research by his superior knowledge of the Greek language and literature, and that, in deference to his abilities and peculiar acquirements, his advice had some influence in the selection of laws that was made.

At the end of the same year (302) ten tables of laws were ready. They were first set up in a conspicuous place, in order that they might be read and examined by the people, who were invited to suggest such alterations as they might judge requisite. Afterwards, the revised tables, having received the previous sanction of the senate, were approved as law in the *comitia centuriata* and the *curiæ*. They were then openly erected in the forum, that all men might know and observe them—erected *pro Rostris*, says Pomponius, by anachronism or by anticipation, for the Rostra were not set up in the forum until more than a hundred years afterwards (Liv. viii. 14).

The Ten Tables were probably intended to be a complete work, and by their fairness and impartiality they gave satisfaction to the people. Through the contrivance of Appius Claudius, who had succeeded in obtaining popular favour, and wished to make the new constitution perpetual, a rumour became rife that further laws were wanted, and a new election of decemvirs was brought about in the year 303 for the purpose of making some additions to the former legislation. Appius was placed at the head of the newly-elected decemvirs, who were his creatures. Among them, Dionysius says (x. 58) there were three plebeians, and Niebuhr will have it that there were five plebeians, though Livy (iv. 3, *fin.*) speaks only of patricians. Two new tables, "*quorum*," says Cicero (*De Rep.* ii. 36), "*non similiter fides nec justitia laudata*," were composed in the year 304, but were first published in 305, after the abolition of the decemvirate, along with the other ten tables by the consuls L. Valerius and M. Horatius (Liv. iii. 57). This publication seems to have been a final promulgation, and not to have resembled the preliminary publication of the first ten tables, when they were set up for public revision. It is not likely that the efficacy of the last two tables was allowed to depend on the legislative power previously delegated to their compilers. There is indeed nowhere any express statement that they were ratified by the centuries, but the fact may be inferred from the name *lex* given to the whole collection. The law of the Twelve Tables was early known by various names: *Lex XII. Tabularum*, *Lex decemviralis*, *Leges XII.*, or simply *Leges*, or *Lex*, or *XII.* The epithet *legitimum* is often peculiarly applied to legal transactions regulated by the Twelve Tables.

In the preceding account, we see one of the ordinary lessons of history—long and steady efforts, stimulated by real wants, at length successful, and great questions involving the interests of contending factions settled by mutual concessions. The memory of the classical reader will revert to those pages of surpassing beauty wherein Livy relates the circumstances that led to the restoration of the old constitution—the tragic tale of lust veiling its dark purposes under the forms of justice—the poem of Appius and Virginia.

VOL. II.

The collection consisted of public as well as private laws; so that, even in Livy's time, it might be called "*Corpus omnis juris Romani; fons publici privatique juris*" (Liv. iii. 34). Tacitus, with that sententious sarcasm upon his own age to which he was much addicted, gives to it the appellation of the last impartial law that existed in Rome, "*finis æqui juris*" (Ann. iii. 27). Cicero, in his boyhood, as other boys were then wont, learned it by heart, "*ut carmen necessarium*," (*De Leg.* ii. 23), although when he was a man the prætor's edict had begun to take its place. The term *carmen*, which is applicable to any solemn form of words, perhaps gave origin to the notion that the whole collection was written in verse. Vico, from the fragments and imitations preserved in Cicero *de Legibus*, imagined that it was composed in Adonic metre. The praise which Cicero bestows upon it by the mouth of Crassus (*de Or.* i. 44) is high and exaggerated. "*Fremant omnes licet, dicam quod sentio: bibliothecas mehercule omnium philosophorum, unus mihi videtur XII tabularum libellus, si quis legum fontes et capita viderit, et auctoritatis pondere, et utilitatis ubertate superare.*" It never was repealed, and up to the age of Justinian its maxims and rules were quoted as authority. From Sidonius Apollinaris, a writer in the fifth century of our era, we learn that it was publicly taught in his day (xxiii, v. 448—451):—

*Sive ad doctiloqui Leonis ædes,
Quo bis sex tabulas docente juris,
Ultero Appius Claudius taceret,
Claro obscurior in decemviratu.*

The frequent occasional legislation on public affairs in times subsequent to its enactment must have materially derogated from its provisions with respect to the constitution and administration of government; and this is probably the reason why so few of the fragments that have come down to us relate to public law. It prescribed certain forms of proceeding called *legis actiones*, and there is reason to believe that one of the earliest considerable reforms which made a large part of it obsolete, and diminished its importance in private law, was the enactment of the *Lex Æbutia* (of uncertain date, but probably to be referred to the sixth century of the city), which abolished the old *legis actiones* except in causes tried before the *centumviri* (compare Gell. xiv. 10 with Gai. iv. 30). L. Charondas (L. Caron) brought forward (*ad Udalr. Zasii Catalogum legum*) the following inscription stated to have been found on an ancient tablet, but there is no doubt of its spuriousness. "*L. Æbutius Tr. Pl. vir popularis, legem tulit ad populum, ut XII tab. capita quæ inutilia essent reip. tollerentur, quæ lex multis contradicentibus tandem rogata est.*" Though many other laws besides the *Lex Æbutia* might be cited as derogating from the Twelve Tables, it was not so much by express and direct enactment as by the *jus honorarium* gradually introduced by the magistrates, particularly the prætors, and by the interpretation of the juriconsults, that they were, slowly and cautiously, modified or supplanted. One of the evils of superstitious adherence to a code was visible in the barbarism which sheltered in this ancient sanctuary, was never entirely banished from the Roman law.

What was the material of the tables upon which the laws were engraven? This has been a subject of much controversy. Some say oak, some brass or bronze (*æs*), and others, with Pomponius (who pro-

tables
themselves.

Law.

bably judged from the manners of his own time), ivory. Some give one material to the first ten tables, and another to the last two, or one material at first and another afterwards. Those who wish profoundly to study the grounds of the divers opinions touching these matters (on which "the same skill and the same degree of skill" have been expended as on greater things) may consult Zimmern (R. R. G. i. § 31).

Upon the burning of the city by the Gauls, the Twelve Tables perished, but search was made for the laws they contained, which were found and engraven on new tables that were set up in the forum near the Curia Hostilia (Liv. vi. 1, and Val. Max. ix. 5). Cyprian (who died a martyr, A.D. 258) has the following remarkable passage (*De Gratia Dei*. lib. ii. ep. 4, *ad Donatum*): "*Forum fortasse videatur immune—plura illic quæ detesteris, invenies. Incisæ sint licet leges duodecim tabulis, et publice ære præfixo jura præscripta sint, inter leges ipsas delinquitur, inter jura peccatur.*" From this it has been inferred that the Twelve Tables were in existence at Rome in the beginning of the third century of the Christian era; but it is not clear that Cyprian was not speaking of Carthage, or of more recent tables of criminal laws. One of the old glossators, Odofredus, who died 1265, assigns to certain fragments of two tables still longer duration by asserting that they actually existed in the Lateran at Rome in his own time. He was a man of little historical knowledge or critical power, but we think it worth while to insert his words (Odofred. in *Dig. Vet. l. Jus Civile* (6) *de Justitia et Jure* (i. 1)): "*Et de istis duabus tabulis aliquid est apud Lateranum Rome: et male sunt scripte: quia non est ibi punctus, nec (§) in litera (i. e. in the text) et nisi revolveritis literas, non possetis aliquid intelligere.*" This cannot be understood as a jocular invention, like those in which the grave glossators sometimes indulge, as in the account of the origin of the Twelve Tables to be found in the gloss on l. 2, § 4, *D. de O. J.* (ii. 1). There we read how the Athenians sent a wise man to Rome to see whether the Romans were worthy to receive laws from Greece; how a fool was selected to dispute with the wise man, in order that, if the fool should be defeated, *tantum derisio esset*; how the wise man held up one finger, the fool three; the wise man his open palm, the fool his clenched fist; and how the wise man was satisfied that the Romans were worthy by the deep meaning which he assigned to the gestures of the fool. In the law-schools of the middle ages, the dunces, with simple credulity, would swallow all this; the smarter freshmen, tittering, would humour the joke. Modern dunces are acute enough to discover the absurdity of the story, and to wonder at the ignorance of the old glossators.

Controversy as to the mission to Athens and the adoption of Athenian laws.

The materials of which the collection was composed consisted in part of the laws and customs of the Romans themselves. So far it resembled many of the old Teutonic collections of laws, which rather established uniformity by legislative sanction on the foundation of pre-existing institutions, than introduced enactments completely new. Its language was more vigorous and concise than that of the French *coutumiers*, to which it may in some respects be compared. It was not, however, a mere consolidation and amendment of rules already in force, but it borrowed novel improvements from foreign jurisprudence (Dion. H. x. 66). In many of the marked characters of the political and social constitution of early Rome,—the

senate—legislative assemblies of the citizens—the system of slavery—of clientship,—we discern the lineaments which were common among the Grecian races, and which must have been previously familiar to the founders of the city. The central and southern parts of Italy afforded specimens of Grecian colonies, and the ancient Romans were not so proud as to reject what was useful because it was foreign, nor so unenlightened as to be wholly ignorant of the arts and fame of their more eastern Athenian brethren. In sending deputies to Athens, they cannot be justly charged with seeking to engraft upon their own system the misplaced produce of an uncongenial stock;—their plan was rather "*antiquam exquirere matrem.*" How far the decemvirs extended their researches may well admit of doubt. Tacitus (*Ann.* iii. 27), with relation to them, employs the wide expression, "*accitis quæ usquar egregia.*" Similar are the words of Gellius (xx. 1, *init.*), "*inquisitis exploratisque multarum urbium legibus.*" Servius says (*ad Virg. Æn.* vii. 695), that part of the Twelve Tables, comprising the Fecial Law, was taken from the *Æqui Falisci*; but Livy (i. 32) reports that this introduction of the Fecial Law was the work of Ancus Martius. Dionysius mentions not only Athens but the Greek cities of Italy. Several authors, in reference to the regulations against luxury, speak of the Lacedæmonian polity (which was based on unwritten laws) as having been the model of the Roman (See Plin. *Ep.* viii. 24; Amm. Marc. xvi. 6; Sym. *Epp.* iii. 11; *Athen. Deipn.* vi. 106).

Whatever conclusion may be arrived at with respect to other sources, there is good authority for maintaining that much was borrowed from the Athenian laws attributed to Solon. By some distinguished writers,—among whom Vico and Gibbon are pre-eminent,—the mission to Greece, and even the existence of the Grecian laws, in the decemviral legislation, have been doubted. The controversy which has arisen upon this subject has employed many modern pens. Among others, Bonamy, Damiano, Gratama, Levesque, Stramigioli, Lelièvre, Valeriani, Ciampi, Cosman, and Maciejowski, have all entered the field, some on one side, some on the other. For an indifferent account of the controversy, by Berriat St. Prix, the reader may be referred to two articles in the *Thémis*, tom. iv. 304, and tom. vi. 269.

We hold with those who see no improbability in the mission, and who consider the insertion of Athenian laws in the Twelve Tables to be established beyond doubt. The Grecian contemporary historians certainly pass over the mission without notice; but then, how insignificant in Grecian eyes would have been the advent of a few barbarians, whose visit produced no visible effects on the state of political parties! Cicero certainly, in a rhetorical passage (*de Or.* i. 44), extols the Roman *jus civile* above the meagre and uncultivated legislation of Lycurgus, Draco, and Solon; but then, no one asserts that the Twelve Tables were all in origin Greek, and the *jus civile* in Cicero's time was more than the Twelve Tables. It comprised all the jurisprudence developed by technical skill. Besides, there is nothing either strange or inconsistent in looking down on those who have helped us to attain our present elevation. Cicero certainly nowhere expressly mentions the embassy,—not even when relating the history of the decemviral legislation (*de Rep.* ii. 36);—but then nothing can be more express than the testimony of Cicero himself to a point of much greater importance, namely, the adoption of parti-

Law.

Law. cular laws of Solon by the decemvirs. In his treatise, *de Legibus* (ii. 23), he says, "*Jam cætera in XII. minuendi [sunt] sumptus lamentationisque funeris translata de Solonis fere legibus.*" Again, with reference to the same matter, he adds, "*quam legem (sc. Solonis) eisdem prope verbis nostri decemviri in decimam tabulam conjecerunt. Nam de tribus riciniis et pleraque illa Solonis sunt. De lamentis vero expressa verba sunt.*" Against the authority of these passages it is useless to object the undeniable fact that many of the laws given by Cicero, in his treatise *de Legibus*, are mere imitations of the style of the Twelve Tables.

Readers who may wish to see how generally the tradition that the decemvirs copied from the laws of Athens was received by ancient authors, may refer to the following passages, in addition to those which we have already quoted:—Sallust, *Cat.* 51; Flor. i. 24; Pomponius, in l. 2, § iv. *D. de O. J.* (i. 2); Aurel. Victor, 21; Oros. xi. 13; Zonaras, vii. 18; Amm. Marc. xxii. c. ult.; August. *de Civ. Dei*, ii. 16; Isid. v. l. The only author whose words have been cited in opposition to this tradition is Polybius, who (ii. 12) speaks of the embassy sent to the Ætolians and Achæans (A. U. C. 526), in order to explain the Roman proceedings in Illyricum, as the first ἐπιτοκῇ μετὰ πρεσβείας (i. e. the first instance of diplomatic intercourse) between Greece and Rome. Niebuhr asserts that in the law relating to personal *status*, and to the course of procedure, there is a total divergence between the systems of Greece and Rome in all that is substantial and characteristic. The minor resemblances which exist he would attribute to natural circumstances apart from imitation, or to the wide diffusion of certain institutions, such as the division into *gentes*. We cannot, however (*pace tanti viri*), admit so great a divergence as is asserted by Niebuhr in all the leading principles of the law relating to *status*, though it be true that the father and the husband had greater power at Rome than at Athens. In both states the privileges of citizenship consisted of franchises, which were sometimes partially, sometimes altogether, conceded to strangers. In both, adoption was common, and the perpetual guardianship of females prevailed. Between the Athenian and Roman principles of procedure, we see, instead of divergence, a very remarkable correspondence. The narrowing of the question to be tried, by means of artificial pleading calculated to separate the law from the fact, existed probably even in the earliest period of Roman law before *formulae* were substituted for the ruder proceeding of the *legis actiones*. The distinction, which is prominent in our own common law, between the functions of the judge and the jurymen, was at the foundation of the ancient Roman as well as Athenian procedure.*

None of these coincidences may be derivable from the Twelve Tables: some may be accidental, some natural, some traceable to the Pelasgian origin (to use a somewhat indefinite but convenient term) of the Latin race. This cannot be said of the laws to prevent expense in funerals, of which Cicero speaks in the passages already cited. To the identities which they present others may be added, which are equally incapable of being rationally accounted for on any supposition but that of direct borrowing. We know that in early Rome,

as at Athens, there were corporations (*collegia*). Gaius, in his commentary on the Twelve Tables (l. 4, *D. de Collegiis* (xlvii. 22)), cites a decemviral law to the effect that *collegia* might make bye-laws binding on their members, provided that no public laws were thereby infringed. He then quotes the words of an exactly similar Athenian law, attributed to Solon. Again (l. 13, *D. finium regundorum* (x. 1)), he quotes at length a law attributed to Solon (compare Plutarch, in *Solone*, 23, extr.) as being the source of certain Roman rules relating to boundaries.

The provision in the Twelve Tables (see l. 14, § ult. *D. de præscriptis verbis* (xix. 5)) concerning damage done by cattle—*si quadrupes pauperiem fecerit*—is very like a translation of the law of Solon mentioned by Plutarch (Solon, 25)—βλάβης τετραπόδων νόμος. Compare with Plutarch the passage in Paulus (*pr. Si quadrupes*, Paulus, *Rec. Sent.* i. 15), where Cujas, instead of the corrupt reading, *Lege Pesulania*, would introduce *Lege Solonia*.

The law of *furtum* in the Twelve Tables presented many remarkable resemblances to the Athenian law of Φῶρα. "*Sei nox furtum factum esset, sei im occisit, jure caisus esto.*" A law of Solon, preserved in Demosthenes (*adv. Timocrat.*), confers, in similar words, impunity on the slayer of the nocturnal thief. It may be urged that such a distinction between *burglary* and diurnal theft is natural. It is made by Moses (*Exod.* xxii. 2, 3), and it appears in some of the Teutonic codes (See Grotius, *de J. B.* lib. ii. c. 1, sec. 12, n.).

Be it so. What shall be said of *furtum per lancem et licium conceptum*? A man who suspected that stolen goods belonging to him were concealed in another's house was allowed by the Twelve Tables to search for his property, but he was obliged to go into the suspected house with no more clothing than a linen clout (*licium*) around his loins, holding a platter (*lancem*) over his head. Thus, naked, and with both hands engaged, the searcher had no opportunity of carrying anything about him and putting it into his neighbour's house for the purpose of making a false charge. The platter was wanted to occupy the hands, not, as some have supposed, to carry away the stolen property, if found (Gai. iii. sec. 192, 3). Festus says (*v. Lance*) that the searcher "*lancem ante oculos tenebat, propter matrum familias aut virginum præsentiam.*" Some one naturally asks, if the platter be used to prevent the searcher from seeing the ladies, how can he look for his goods? Heineccius (*Ant. Synt.* iv. 1, 19) answers,—Ridiculous question! *Lanx* was not a platter but a mask, and was used not to prevent the searcher from seeing the ladies, but to prevent *them* from recognizing his features. From Petr. Arb. *Sat.* c. 97 (cited by Heinecc. *Ant. Synt.* lib. iv. tit. 1, sec. 21), we may collect what the practice was at a comparatively advanced age. There the search for a runaway or kidnapped slave is made by public officers, while the owner, who accompanies them, is dressed in a *versicoloria vestis* instead of the *licium*, and makes use of a silver *lanx* to contain the money offered as a reward for the discovery (*in lance argentea indicium et fidem (?) præferebat*). The constant adherence of the Romans to their ancient customs is proved by their clinging to this ceremony when its meaning was forgotten, and the proper manner of going through its forms had become a matter of dispute among lawyers. That a custom nearly in all respects similar to this was in force among the

* This was long ago observed by Dr. Pettingal, in his *Inquiry into the Use and Practice of Juries among the Greeks and Romans*, London, 1769.

Law.

Athenians, appears from the *Clouds* of Aristophanes (v. 496, *et seq.*), where the scholiast explains the nature and reasons of the proceeding. It is not unlikely that the very terms of the Athenian law correspond with the fictitious law given by Plato (*de Legibus*, lib. xii). Neither Plato, however, nor Aristophanes, nor the scholiast, mentions anything in the Grecian ceremony answering to the Roman *lanx*.

Perhaps we have said enough to establish the high probability of the common belief that the laws of the Twelve Tables derived some rules from Athens. Their fragments have been compared with the fragments of Solon's laws in several elaborate works. Petrus, Præteius (in Otto's *Thes. Jur. Rom.* tom. iv.), and Rittershusius, have laboured in this field; but none have equalled in celebrity Salmasius and his generally victorious opponent, the more critical and sagacious Heraldus. The bitter *Animadversiones* of the latter is truly an extraordinary monument of immense erudition. Haubold (*Inst. Hist. Dog.* i. 89) refers to various modern writers whose works illustrate the memorable agreement between Roman and Attic law in the various kinds of actions, the different kinds of bail (*vadimonia*), the use of *sponsiones* and *sacramenta*, the *clepsydra* in judicial proceedings, the mode of attesting legal documents, the employment of advocates, the examination by torture of slaves, the distinction between *jus* and *judicium*, and the practice of appointing *judices* by lot. Some Greek technical terms, as *chirographum* and *syngrapha*, appear to have been early introduced; others, as *hypotheca*, *antichresis*, *parapherna*, and *emphyteusis*, were probably later importations from the *jus gentium*. How early the maritime law of the Rhodians may have been adopted by Rome it is impossible to collect with certainty. It seems that, in the time of the free republic, Servius Sulpicius and Ofilius (l. 2, *pr.* and § 3, *D. de Leg. Rhod.* (xiv. 2)) gave opinions on its construction. This we mention, in connexion with the subject of the Twelve Tables, as an example of later recourse to Grecian jurisprudence.

Spirit and character of the decemviral laws.

When we come to examine the remaining contents of the Twelve Tables, we do not find any examples of the abolition of pre-existing distinctions in the legal rights and constitutional privileges of the patricians and plebeians; and we know that many political disqualifications of the latter existed long afterwards. On the other hand, we find no provisions recognizing such distinctions as already in force. The law which prohibited *connubium* between the patricians and plebeians is mentioned by Cicero (*de Rep.* ii. 37) as one of the partial enactments of the last two tables, and is treated by him as a novel hardship,* though Niebuhr looks upon it as only a confirmation of a very early rule. The disability was abolished by the *lex Canuleia* in the year 311. The partial distinctions which we find in the Twelve Tables relate to citizen and foreigner, freeman and slave,—not, except in the case of *connubium*, to patrician and plebeian. For example, in the case of a citizen, by usucaption of immoveable things (*fundus*) property was acquired in two years; of all other things, in one year: but in the case of a stranger, no prescription could defeat the Roman owner's claim—"Adversus hostem æterna auctoritas." The penalty for breaking or crushing the bone of a freeman was 300 *asses* (pounds

of brass); of a slave, 150 *asses* (Gai. iii. 223). We see here nothing like the inequality which pervaded our own Anglo-Saxon laws, in which each man's *were* was adjusted with great nicety according to his rank, ecclesiastic or civil.

Perhaps the most ancient rules in the Teutonic codes are those which, with careful minuteness, fix the pecuniary compensation to be paid for every bodily injury according to its position, severity, and extent. The Twelve Tables went upon the same principle, but their scale was not sufficiently sliding. A practical commentary on the roughness,—the want of philosophic refinement,—of their legislation was afforded by a waggish madcap (*egregie homo improbus atque immani vecordia*), one Lucius Veratius, whose great delight it was to go about slapping the faces of free citizens with the palm of his hand. A slave used to walk behind him, laden with a heavy purse (for money in those days was a ponderous commodity); and Veratius, as soon as he had boxed a cheek, ordered his slave to weigh out the legitimate 25 *asses* to the insulted citizen, in pursuance of the rule, "*Si injuriam faxit alteri, xxv. æris pænæ sunt*" (Gell. xx. 1).

The Twelve Tables, without expressly making different laws for different orders, did yet, by the severe regulations with respect to debtors, which we proceed to explain, make in effect one law for the rich, another for the poor. Their words may possibly have been "*Forti sanatique, nexo solutoque, idem jus esto*," but such was not the spirit of their legislation.

Debtors, proved to be such by confession *in jure* or by trial, were allowed 30 days to seek for the means of discharging their debts. If a debtor, after the 30 days, was unable to pay, he might be summoned before the magistrate (*in jus vocatio*), and, if necessary, arrested (*manus injectio*) by the creditor. In speaking of the magistrate, we must be understood to mean, before the institution of the prætorship, one of the consuls; afterwards, the *prætor urbanus*. If no one now offered to be his security, his sentence was severe. Taken to the creditor's house, he was there kept for 60 days, unless he could pay or make terms, bound with a chain not exceeding 15 pounds in weight, and, unless he chose to live at his own cost (which might well be, as his property could not be touched by his creditor), fed with a pound of corn daily. In the latter part of this period, he was brought before the magistrate in the forum on three successive market-days, and proclamation made of the adjudged debt, in order to see if any one would yet come forward on his behalf. On the third market-day (the 60 days being expired), if no friend appeared, he was put to death (*capite pœnas dabat**) or sold as a slave into a foreign land beyond the Tiber, the execution of the sentence being probably left to the creditor. If there were several creditors—we will give the very words of the law,—

"*Tertiis nundinis partis secanto, si plus minusve secuerunt, se fraude esto.*"

Many and ardent have been the controversies of the learned upon the meaning of these words (See Zimmern, *R. R. G.* 1, sec. 46, n. 17). Some, of whom Bynkershoek is the great champion, and among whom our

* *Duabus tabulis iniquarum legum additis, quibus etiam quæ dijunctis populis tribui solent, connubia, hæc illi ut ne plebei cum patribus essent inhumanissimâ lege sanxerunt.*

* *Capite pœnas dabat* is here undoubtedly used to denote what we ordinarily understand by capital punishment. In a general sense, any punishment was *capitalis* which involved the loss of life, freedom, or citizenship (l. 2, *pr. D. de Pœnis*, xlviii. 19).

Law.

countryman, Dr. Taylor, may be mentioned, have taken them figuratively, understanding by the *sectio* the sharing of the debtor's labour, or the division and sale of his property. We agree with the conclusion of those who, in accordance with every allusion to the subject extant in the ancient classics, take the literal sense. Dr. Arnold (*Roman History*, i. 136, &c.) well remarks,—

“Some modern writers have imagined that the words ‘*partis secanto*’ were to be understood of a division of the debtor's property, and not of his person. But Niebuhr well observes, that the following provision alone refutes such a notion—a provision giving to the creditor that very security in the infliction of his cruelty which Shylock had in his bond omitted to insert: ‘*Si plus minusve secuerunt, se fraude esto.*’ Besides, the last penalty reserved for him who continued obstinate was likely to be atrocious in its severity. What do we think of the *peine forte et dure* denounced by the English law against a prisoner who refused to plead? a penalty not repealed till the middle of the last century, and quite as cruel as that of the law of the Twelve Tables, and not less unjust.”

The concluding remarks of Dr. Arnold upon this subject appear to be in the main so just and important that we cannot refrain from adding them to the preceding quotation:

“Aulus Gellius, who wrote in the age of the Antonines, declares that he had never heard or read of a single instance in which this concluding provision had been acted upon. But who was there to record the particular cruelties of the Roman burghers (patricians) in the third century of Rome? and when we are told generally that they enforced the law against their debtors with merciless severity, can we doubt that there were individual monsters, like the Shylock and Front de Bœuf of fiction, or the Earl of Cassilis of real history, who would gratify their malice against an obnoxious or obstinate debtor, even to the extremest letter of the law? It is more important to observe that this horrible law was *continued* in the Twelve Tables, for we cannot suppose it to have been introduced there for the first time; that is to say, that it made part of a code sanctioned by the commons (plebeians) when they were triumphant over their adversaries. This shews that the extremest cruelty against an insolvent debtor was not repugnant to the general feeling of the commons themselves, and confirms the remark of Gellius, that the Romans had the greatest abhorrence of breach of faith, or a failure in performing engagements, whether in private matters or in public. It explains also the long patience of the commons under their distress; and, when at last it became too grievous to endure, their extraordinary moderation in remedying it. Severity against a careless or fraudulent debtor seemed to them perfectly just: they only desired protection in case of unavoidable misfortune or wanton cruelty, and this object appeared to be fulfilled by the institution of the tribuneship,—for the tribune's power of protection enabled him to interpose in defence of the unfortunate, while he suffered the law to take its course against the obstinate and the dishonest.”

Perhaps, in the passage last cited, may be traced an excess of favour to the plebeian party. It is not improbable that those plebeians who were beginning to acquire political ascendancy when the law of the Twelve Tables was sanctioned, could number at their head

many wealthy citizens—the foremost classes in the centuries—who already, by the influence of money, were able to present an opposing front to the influence of birth and rank. Merchandise and commerce were greatly extended even in the first period of Roman history; and it has often happened in the annals of the world that a rising monied interest has been a powerful instrument in democratic hands. If the plebeian knights and wealthy plebeian money-lenders were at the head of their party, it is easy to see why their zeal in the reformation of abuses should have stopped short where an alteration of the old law would have diminished their own power.

One of the most profound philologers and antiquaries that ever lived, Jacob Grimm, in his excellent *Deutsche Rechts-Alterthümer* (p. 613, *et seq.*), gives some examples in Teutonic law of similar severities to debtors, which are evidently borrowed from the law of the Twelve Tables. He, too, adverts to the horrid tales founded upon the horrid facts, and refers to the *Pecorone* of Giovanni the Florentine (Giorn. 4, Nov. 1), which was written in 1378, as the probable original of Shakspeare's Shylock.

The provision for selling a Roman beyond the Tiber deserves notice. By the direction that the sale should take place in a foreign country, the conversion of a freeman into a slave was less anomalous and less repugnant to received notions. A free Roman could not become a slave by his own private convention (l. 37, *D. de liberali Causâ* (xl. 12)). To effect so great a change by peaceful means a judicial sentence was required. The law, however, admitted that strangers might, by right of conquest, make slaves of Roman citizens. Whether debtors might become *nexi* (who, though not slaves, were *servorum loco*) without judicial sentence is a disputed question, which we cannot enter upon now.

It is not unlikely that the extreme cruelty of the law against debtors arose from a cause similar to that which gave occasion to the *peine forte et dure* in our own jurisprudence (See Barrington's *Observations on the Ancient Statutes*, p. 86). With us, the felon who stood mute, and was pressed to death, might thus save his broad lands. The forfeiture was not incurred which would have followed conviction and sentence. In like manner, the early Roman law was severe because it was imperfect. It gave no execution against property, which could only be reached indirectly by the constraint of execution against the person. Private property was not transferred by the law, and could not pass except by acts emanating from the will of the owner. This defect was gradually remedied, partly by direct legislation, and partly by the *jus honorarium*. The *peine forte et dure* is not the sole example in our English system of powers short in one direction and unduly stretched in another. The Court of Chancery could give effect to its decrees respecting property only by operating against the person. If a defendant chose to endure close imprisonment, and to brave all the terrors of process for contempt, the plaintiff had no redress except the gratification of revenge. Cases might still be pointed out in our law in which courts, from the want of appropriate powers, are compelled to work upon the *will* in such a manner, that judges appear to be waging an unseemly contest with an individual, while their sentence is liable to be baffled by a conscientious, an obstinate, or a wrong-headed man.

Law.

Law. Thus the law may have all the odium of inhuman and disproportionate severity without any of the merit of efficaciousness.

The creditor's right to take to his house (*ducere*) the sentenced debtor resembles the Athenian practice concerning ἀγῶγμοι.

The statement we have given of the law of debtor and creditor as it existed in the Twelve Tables, is extracted principally from the animated discussion between the jurisconsult Sextus Cæcilius and the philosopher Favorinus, reported by Gellius (*N. A.* xx. 1). There is something almost burlesque in the cold pedantry with which Cæcilius attempts to vindicate the barbarity of the "*partis secanto*," by reference to the legend of Metius Fufetius Albanus, and the harsh remark of Virgil,—

At tu dictis, Albane, maneres.

Ancient commentaries on the Twelve Tables.

The Twelve Tables, from the great conciseness of their enactments, stood in need, like our ancient Acts of Parliament, of a very liberal interpretation and extension by analogy. They required also that the particular modes of proceeding to be used in taking advantage of their provisions should be settled by precedent and practice. The earliest commentator on the Twelve Tables, whose name is known, was S. Ælius Catus, who was consul A.U.C. 556. His work was entitled *Tripertita*, from containing, first, the text; secondly, the interpretation (sometimes called specially *jus civile*); and thirdly, the forms used in procedure. We also know that Antistius Labeo and Gaius wrote extended commentaries, and the same may be said with much probability of L. Acilius (or Atilius), of L. Ælius (or Lælius), of Valerius Messala, and of S. Sulpicius Rufus.

Modern literary history of the laws of the Twelve Tables.

We possess but few fragments of the Twelve Tables literally. More often the purport of their enactments has been given by an author in his own words. The principal writers from whom our knowledge of their contents is derived are Cicero, Gaius, the elder Pliny, Festus, Gellius, Macrobius and Servius. From the commentary of Gaius on the Twelve Tables, twenty extracts are contained in the *Pandects*, and one in Joannes Lydus. The treatise *De Republica* of Cicero, the *Institutes* of Gaius, and Mai's Vatican fragments, have furnished the present century with some additional information unknown to former ages.

In attempting to restore the text, the moderns have taken the same liberties with the Twelve Tables as with the laws of the kings, and the controversy on their Latinity between Funccius and Branchu may still be consulted with interest by philologists.

The modern collectors and interpreters have been very numerous. Of these, J. Lipsius, Fr. Balduinus, Jac. Rævardus, Theod. Marcilius, Ant. Augustinus, and Conr. Rittershusius are among the foremost. As an Englishman, Ricardus Vitus Basinstochius (*i. e.* Richard White of Basingstoke) deserves notice. He is said by Bach to have been professor of the *Pandects in Academia Duacensâ* (Douai). His work, which is extremely rare, contains notes on the laws of the Twelve Tables according to the order of the *Institutes* and the first part of the *Digest*. The strange and confused title of it is (according to Bach, *Hist. Jur. Rom.* ed. 1807, p. 35) *Ricardi Viti, Basinstochii, ad Leges Decemviorum in duodecim Tabulis, Institutiones Juris Civilis in quatuor libris, primam partem Digestorum in quatuor*

libris notæ juris interpretati (8vo. Atrebatii, (Arras), 1597). But in collecting, arranging, and interpreting, no one of his predecessors approached the merits of Jac. Godefroi, whose labours have been the groundwork of nearly all that has been subsequently effected. Dirksen, who, since the time of Godefroi, has done more than any other person for the Twelve Tables, acknowledges that any attempt to restore the original order of the text must be founded on the principles which the ingenuity of Godefroi suggested. The Twelve Tables, as they appear in all ordinary books, are for the most part borrowed from Godefroi's restoration, which may be found in his *Fontes quatuor Juris Civilis*. It is inserted by Otto with a valuable preface in the third volume of his *Thesaurus*. The second edition of M. A. Bouchaud's voluminous *Commentaire sur la Loi des Douze Tables* appeared at Paris in 1803 (2 tomes, 4to). It is one of the works most frequently referred to, on account of the mass of materials it contains. Dirksen is celebrated for the sound and cautious criticism with which he has conducted his investigations, and for the ability with which he has reviewed all preceding researches. His work (which is a *chef-d'œuvre*) is entitled *Uebersicht der bisherigen Versuche zur Kritik und Herstellung des Textes der Zwölf-Tafel-Fragmente* (Leipz. 1824).

Our knowledge of the method observed in the Twelve Tables, so far as it depends upon positive authority, is exceedingly small. We know from Cicero (*De Leg.* ii. 4) that they began with the law of procedure. A rule quoted by Festus (*v. Reus*) as the second law of the second table relates to reasons for postponing the trial of a cause. Dionysius (ii. 27) states that a law of Romulus concerning the power of the father was inserted in the fourth table. Cicero places the regulations as to funerals in the tenth; and we are told by Cicero and Dionysius (x. 60) that the law prohibiting *connubium* between patricians and plebeians was in one of the last two. The Twelve Tables treated of succession by will before they proceeded to succession *ab intestato* (l. 1, pr. *D. Si Tab. Test. null.* (xxxviii. 6)). After directing that the *agnati* should be called to the *hereditas* of an *ingenuus* in default of *sui heredes*, the Twelve Tables, before they proceeded to make provision with respect to the *hereditas* of a *libertinus*, directed that the *tutela* of one who required guardianship should belong to the *agnati* (*see Theoph. ad. § 1, I. de Legit. Patr. Tut.* i. 17). This is all we know. For further arrangement we have only conjecture. Where distinct passages are cited in succession, the order of their citation affords strong evidence of their order in the tables. There is a passage in Ausonius (*Idyl.* xi. 61—64) from which it has been supposed by some, without sufficient reason, that there was a triple division into *jus sacrum*, *privatum*, and *publicum*, to each of which four tables were allotted. The words of Ausonius are,—

*Jus triplex, tabulæ quod ter sanxere quaternæ :
Sacrum, privatum, et populi commune quod usquam est.
Interdictorum trinum genus ; UNDE repulsus
VI fuero, aut UTRUBI fuerit, QUORUM ve BONORUM.
Triplex libertas, capitisque minutio triplex.*

He merely means to state that law, which admits of a threefold division, is the subject of the Twelve Tables; and it suits both his metre and his search for triplets to observe that twelve is a multiple of three.

Law.

Order of subjects in the Twelve Tables.

Law. There is no intention to assert an internal correspondence between the triple division of law and that of the Twelve Tables.

It has generally been taken for granted that each table was complete in itself, and the manner of quoting by the number of the table and the law (of which an instance, already referred to, occurs in Festus), would seem to show that, apart from the division into tables, there was no marked division of subjects or titles which would have given rise to a more natural mode of citation. Puchta, however, has observed that the decemviral laws might have been written consecutively, like the leaves of a book, without any attempt to make the conclusion of a table coincident with a termination in the sense. Illustration may be sought from the analogy of similar tables. Were Solon's tables engraven with such unscientific disregard to system? We think not. It seems that some of the Athenian tables were called *ἄζονες*, others *κύρβεις*, and that the sacred and public laws were engraven on the latter, the private on the former (*Plut. Solon* 25). The scholiast in Aristophanes refers the military laws to the *κύρβεις*. Demosthenes usually quotes the Athenian laws by the number of their tables. The expression *ὁ κάτωθεν νόμος*, occurring in the oration of Demosthenes against Aristocrates, is rightly explained by Taylor, and has nothing to do with the position of the law in one of the tables. Plutarch refers in one passage (*Solon* 19) to the eighth law of the thirteenth table, *ὁ δὲ τρισκαίδεκατος ἄζων τῶν ὀγδοῶν ἔχει [τον] νόμον οὕτως αὐτοῖς ὀνόμασι γεγραμμένον*. The reading of the Bodleian MS. *των νομων* gives some countenance to the opinion that one table was not always large enough to contain one entire law, and that the eighth law extended into the thirteenth table.

The conjectural grounds on which Jac. Godefroi endeavoured to establish the order of the Twelve Tables are ingenious and probable. All the six books of Gaius on the Twelve Tables are quoted in the *Pandects*; and, each book being supposed to relate to two tables, some indication of the subjects of the table is given by the twenty quotations. The tables themselves are supposed to have formed six pairs, two tables of each pair being connected in subject. Rather inconsistently with the last supposition, the eleventh table is supposed to have been supplementary to the first five, the twelfth to the following five, thus severing the third pair. The order of the Prætor's Edict is supposed to have been the same as that of the Twelve Tables, where both treat of the same matters. Some inferences also are deduced from later compilations,—the *Codex Theodosianus*, the *Codex* of Justinian, and the *Pandects*—which are known to have followed (more or less) the order of the Edict. Upon these grounds Jac. Godefroi arrived at the following arrangement: Tab. I. *In jus vocatio*; II. *Judicium et furtum*; III. *Res creditæ, depositum, fœnus*; IV. *Patria potestas et connubium*; V. *Hereditas et tutela*; VI. *Dominium et possessio*; VII. *Delicta*; VIII. *Jura prædiorum*; IX. *Jus publicum*; X. *Jus privatum*; XI. *Supplementa ad Tabb. I.-V.*; XII. *Supplementa ad Tabb. VI.-X.*

Dirksen departs from Jac. Godefroi's arrangement principally in the following particulars. He transfers *connubium* from the fourth of Godefroi to the fifth table. He gives the law of landed property to the sixth table. He makes the seventh contain *obligationes*

ex contractu, including *depositum* and *fœnus*, which are transferred from the third of Godefroi; and he makes the eighth contain *obligationes ex delicto*, including *furtum*, which is transferred from the second.

The Prætor's Edict and the Edict of the Curule Prætor Edict. *Ædiles* can scarcely be treated here as a separate branch of ante-Justinian law, inasmuch as nearly the whole of the remains we possess of them are embodied in the collections of Justinian.

These remains are a portion of the *jus honorarium*, the nature of which we shall very briefly explain.

The Roman magistrates, on their entrance into office, were accustomed to expose publicly (*in albo*) the rules according to which they intended to proceed during their magistracy. The rules thus published as a guide for the whole year of office were called *edicta perpetua*, in contradistinction to the *edicta repentina*, which were promulgated on particular occasions.

Thus, where the law was defective it was supplied, and in many instances its harshness was corrected; but in modifying the *jus civile*, the magistrates, who were sworn to obey the laws, proceeded gradually, and with the sanction of public opinion. Their right of acting with such an instrument of gradual reform was recognized by the constitution, and was exercised more freely in early times, when the wants of mankind extended widely beyond the narrow limits of the *jus civile*, than at a subsequent period, when those wants had been supplied by precedent and direct legislation.

The edicts in general were founded on principles of reason and equity, and the magistrates in composing them often made use of the advice of judicious friends acquainted with the civil law. As the whole set of rules published by a magistrate was called his edict, so each separate rule was often called an edict, as in the Jewish law each section of Mishna is itself called a Mishna. A magistrate usually inserted in his edict those rules of his predecessor which had been approved and found useful. To such *edicta tralatitia* he sometimes added *edicta nova* of his own. The former gradually came much to exceed the latter in number; and, in Cicero's time, the law of the entire prætor's edict had been almost settled by custom (*Cicero de Invent.* ii. 22). The power of making *edicta repentina*, suited to the emergency of particular cases, was sometimes abused; and to remedy such abuse on the part of prætors a *lex Cornelia* (A.U.C. 687) forbade them to depart from their *edicta perpetua*.

Priests and generals, as well as civil magistrates, had their *jus edicendi*. The only magistrates who appear not to have been invested with this power were the *ædiles plebis*, who were bound by the edict of the curule ædiles (*Theoph. lib. i. tit. ii. sec. vii.*). Of all the edicts, those of the prætors were the most important; but mention is frequently made in ancient writers of the edicts of the censors, tribunes, and governors of provinces. The name *jus honorarium* given to the department of law thus introduced by magistrates arose from the circumstance that the magistrates possessed *honores*. Some of the ancients were in favour of a different and less probable origin. They thought that *jus honorarium* was so called because it was observed *in honorem magistratum* (§ 7, *I. de Jur. Nat.* (i. 2); l. 7, § 1, *D. de J. & J.* (i. 1)).

Many of the Roman jurists occupied themselves in commenting upon and arranging the prætors' edicts when they began to assume a permanent shape.

Law.

The first who distinguished himself in this pursuit was Ofilius, a friend of Cæsar. Servius Sulpicius, the master of Ofilius and well-known friend of Cicero, had previously composed a short compendium of prætorian law. The edict of the prætor peregrinus, and those of provincial governors, probably agreed in most respects with those of the prætor urbanus, and differed only where the peculiarities of their jurisdiction and local circumstances required distinct provisions.

A memorable epoch in the history of prætorian law occurred in the reign of Hadrian, when Salvius Julianus, an eminent lawyer, revised and arranged, under the auspices of the emperor, the edicts of the prætors and curule ædiles. The eclectic edict, composed out of these materials, was sent to the urban and provincial magistrates as a permanent form. It was called in an eminent sense *edictum perpetuum*, the word *perpetuum* having now acquired a different meaning from that in which it was first employed. The reformed edict of Julian or Hadrian was the perpetual edict, inasmuch as it was intended to remain unchanged for an indefinite time; whereas a perpetual edict was anciently one which was intended to regulate the conduct of the magistrate *continuously* during his period of office.

The magistrates, however, even after the composition of Salvius Julianus, retained the *jus edicendi* upon points not determined by the *edictum perpetuum* or by other positive legislation (Cassiodor. *Varia*, vi. 18; l. 2, *C. de Off. P. P.* (i. 26)). An example of this may be seen in three edicts of the *præfectus prætorio*, which, in ordinary editions of the *Corpus Juris*, are printed as *Novells* of Justinian, and numbered 166-168. The exact extent and effect of the labours of Salvius Julianus are much, and, from the paucity and obscurity of historical record concerning them, perhaps hopelessly, controverted. Some difficulties will be surmounted, if we suppose that the main body of his work consisted of a fusion of edicts, urban and provincial, which might be adapted, by means of variable formal parts and minor alterations, to the use of different magistrates. It is not unlikely that the change was connected with the new judicial organization of Italy, which was effected under Hadrian.

In the fragments of juriconsults collected in the *Pandects*, certain parts of the perpetual edict are quoted much more than others. We have thus many more fragments relating to interdicts than to *possessio bonorum*. When a commentator on the prætor's edict is cited in the *Pandects*, the number of the book of the commentary is stated; and thus means are afforded of arriving at the order of arrangement observed in that edition of the Prætor's Edict, namely, the *Edictum Perpetuum Hadriani*, to which all the commentaries cited in the *Pandects* refer. The arrangement was probably more historical than scientific, and it is likely that sometimes subjects were brought together, not because of any natural connexion, but because they were associated by means of a technical term which had different meanings. Thus, under the head *de edendo*, it is likely that the accident of similar name brought together clauses concerning the *editio* of actions, and the *editio* of the accounts of an *argentarius*.

It is generally supposed to have been divided into seven parts, like the *Pandects*, which Justinian states to have been digested in imitation of the perpetual edict (§ 5, const. *Deo Auctore*). The *partes* were divided

into *tituli* with rubrics, and these again into *capita*.

Law.

Single sentences are sometimes called *clausulæ*.

The division of parts usually adopted by the moderns is as follows:—I. *De jurisdictione et iis quæ fiunt in jure*.

II. *De judiciis*. III. *De rebus creditis*. IV. *De nup-*

tiis, dotibus et tutelis. V. *De furtis, bonorum posses-*

sionibus, testamentis, novi operis nunciatione, damno

infecto, et aquâ. VI. *De manumissionibus, publicanis,*

vi, injuriis, missione in bona et privilegiis creditorum.

VII. *De interdictis, exceptionibus et stipulationibus*.

G. Giphanius, one of the early modern arrangers, proposed a division into ten parts. The collected remains may be seen in many common books: e. g. Van Leeuwen's edition of the *Corpus Juris Civilis*, Jac. Gothofredi *Fontes quatuor Juris Civilis*, Pothier's *Arrangement of the Pandects*, Haubold's *Instit. Hist. Dog. Lin.* tom. ii. On the provisions of the edict Noodt is a most able commentator; and the work of Heineccius, "*Historia Edictorum et Edicti Perpetui*," is exceedingly learned and elaborate. Bouchaud has written several papers on the edicts of the Roman magistrates, in the *Mémoires* of the French Institut. The latest important work on this subject is that of De Weyhe, *Lib. iii. Edicti, sive libri de origine fatisque jurisprudentiæ Romanæ, præsertim Edictorum Prætoris, ac de formâ Edicti Perpetui* (4to. Cellis, 1821). The principal fault of some of the writers we have mentioned is their affecting to be wise beyond what is written in the original sources.

In looking over the remains of the prætor's edict, the English lawyer will observe that from it was derived our writ *de ventre inspiciendo*, which was in established use before the time of Bracton (See l. 1, § 10, *D. de Inspic. Vent.* (xxv. 4)).

The remains of the edict of the Curule Ædiles are contained in the first title of the 25th book of the *Digest*. Aulus Gellius and Festus refer to a more ancient edition than that which is there cited. Thibaut's *Essay on the Ædilitian Edict* is contained in his excellent *Civilistische Abhandlungen*.

The remaining parts of the law of Rome, older than Justinian, and not incorporated in his collections, may be classed under two heads.

A, private technical works, as well

[a,] those which have come down to us separately, in their original purity, as

[b,] those which have been preserved to us in private technical compilations.

B, technical compilations made by the public authority, including as well

[a,] single works (which are, for the most part, mutilated, interpolated, altered, and abridged), as

[b,] collections or codes.

A a. The works and fragments of works of juriconsults which have come down to us in their original purity, without being incorporated in the collections of Justinian, or in earlier compilations, public or private, are of the greatest value. Unfortunately, the number of them is small.

A b. It is remarkable that nothing approaching to a complete collection has yet been formed of the passages in the ancient classics which specially illustrate Roman Jurisprudence, and particularly of those passages which contain extracts from the writings of jurists. There is an exceedingly valuable list of some such passages in the "*Notitia historico-literaria*" at the commencement of Haubold's *Monumenta Legalia*. In 1815, Dirk-

sen published at Königsberg *Bruchstücke aus der Schriften der Römischen Juristen*. A complete collection of such fragments in continuation of Dirksen's work is promised in the prospectus of the Bonn edition of the *Corpus Juris Ante-Justiniani*.

Pure private technical works and fragments of works.

To the heads A [a] and A [b] belong, in addition to some works already mentioned, the following remnants of antiquity. (1), a fragment of Sextus Pomponius. (2), a fragment of Herennius Modestinus. (3), the work entitled *Tituli ex corpore Ulpiani*. (4), Fragments from the *Institutiones* of Ulpian. (5), *Fragmentum Regularum, ex veteri jureconsulto*. (6), *D. Hadriani sententiæ et epistolæ*. (7), *Consultatio veteris jureconsulti*. (8), *Mosaicarum et Romanarum Legum Collatio*. (9), *Gaii Institutiones*. (10), *Fragmentum de Jure Fisci*. (11), *Fragmenta Juris Romani Vaticana*. (12), *Fragmentum Græcum de obligationum causis*. Of these we shall now treat in order.

Fragment of Pomponius.

(1.) Arnoldus Ferronius, in his *Consuetudinum Burdigalensium Commentarii* (4to., Lugd. 1536), published a minute fragment (18 words) of Sextus Pomponius, taken from a most ancient worm-eaten MS. which had formerly belonged to the library of Petrus Crinitus of Florence, and had been given to Ferronius by J. C. Scaliger. It was copied by Cujas from Ferronius, and was lately brought again to light by A. G. Cramer in Hugo's *Civilist. Mag.* vi. 1-33.

Fragment of Modestinus.

(2.) A fragment of Herennius Modestinus, still shorter than the fragment of Pomponius, was first published (4to. Lutet. 1573) by P. Pithæus, from a manuscript of his father, along with the *Mosaicarum et Romanarum Legum Collatio*. Another fragment of Modestinus, preserved by Isidore, concerning the difference between relegation and deportation is mentioned by Böcking, *Ulpiani fragmenta*, p. 109 (Bonn, 1836).

Tituli ex corpore Ulpiani.

(3.) From these unimportant fragments we pass to a source of considerable value, namely, the fragments of Ulpian, first published by Tilius (Du Tillet) (8vo. Paris, 1549) under the name *Tituli ex corpore Ulpiani*. The text of Tilius was taken from a Vatican manuscript (codex 1128), from which all other existing manuscripts of the work are copied (See Zimmern, *R. R. G.* i. 21, n. 25). This position has been lately controverted by G. E. Heimbach (*über Ulpian's Fragmente*, Leipz. 1834), who has been successfully answered by Savigny (9 *Zeitschrift*, p. 157). The 29 titles of Ulpian thus preserved are now generally thought to have been part of Ulpian's *Liber Singularis Regularum*. G. E. Heimbach, indeed, has supposed, without sufficient ground, that they are a collection from the works of various jurists. The Vatican manuscript of these fragments of Ulpian is at the end of a manuscript of the Westgothic compilation, called the *Breviarium Aniani*, of which we shall hereafter speak, but the fragments are pure, and form no part of that compilation. Ulpian was never popular in the Western Empire. The present work has no trace of interpolation or Westgothic interpretation, and it deals too much in antiquated law (of which it was the most valuable source before the discovery of the genuine Gaius), to suit the purpose of the Westgothic compilers. Its style, indeed, is more concise than is usual with Ulpian. It is manifestly imperfect at the beginning and the end. It treats of persons, property, successions, but not of obligations nor of actions. It has been illustrated by the notes of Cujas, Schulting, Meerman, and Cannegieter. The first really accurate edition of the text was given by Hugo,

Berlin, 1822. Among the most valuable observations on the *Tituli ex corpore Ulpiani* are those of Schilling, *Animadversionis Criticæ ad Ulpiani fragmenta Specim.* i. ii. (Vratislay, 1830), and those of Savigny in the 9th volume of the *Zeitschrift*. The last and best edition is that of Böcking, contained in his *Ulpiani Fragmenta* (Bonn, 1836).

(4.) The recent discovery made by Stephen Endlicher of some short but not unimportant fragments of the Institutes of Ulpian deserves to be mentioned on account of its singularity. In the Royal Library at Vienna was a papyrus manuscript, in its original binding. Strips of parchment had been employed by the book-binder to fasten the leaves together. S. Endlicher perceived that five of these strips were cut out of a legal manuscript, and that in one of them the column of writing was headed *Ulp. Inst.* Of the decyphered characters, a part relates to contracts, and the rest furnishes some new and interesting information concerning the interdict *Quem Fundum*. A fac-simile may be seen in Endlicher's *Catalogus codd. philolog. lat. bibl. palat.* (Vindob. 1836, tab. iii.) The text is given by Savigny, with valuable remarks, in the 9th volume of the *Zeitschrift*; by Pellat, in the 4th volume of the Brussels *Revue de Législation et de Jurisprudence*; and by Böcking in the work already cited, *Ulpiani Fragmenta* (Bonn, 1836).

Law.

Endlicher's fragments of Ulpian's Institutes.

(5.) The *Fragmentum Regularum ex veteri jureconsulto* has been published with various names. We follow that which is given by Schulting in his *Jurisp. Ante-Just.* In the *Corp. Jur. Ante-J.* edited by the Bonn Professors, it is called by Böcking, *Disputatio forensis de Manumissionibus*.

Fragmentum Regularum ex veteri jureconsulto.

The history of this fragment is curious. In the beginning of the third century of our era (A. D. 207, *Maximo et Apro consulibus*), Dositheus Magister, a schoolmaster who taught Greek and Latin, composed a school-book under the title *ἐρμηνεύματα* or *interpretamenta*, in three books. Of these, the first two contained a grammar and glossaries; the third, a collection of subjects for translation from Latin into Greek, and *vice versa* (1 Puchta, *Inst. R. R.* 495). These subjects consisted for the most part of extracts from other writers. Among them is the fragment we are now treating of, extracted from a legal writer, and containing some remarks on the division of *jus* into *civile, naturale*, and *gentium*, the division of persons into freeborn and freedmen, and the law of manumissions. The manuscripts of Dositheus contain a Greek text, and a miserable, often unintelligible, Latin one. It cannot be doubted that the Greek is translated from a Latin original; and the Latin text that has come down to us has been conjectured by Lachmann (*Versuch über Dositheus*, Berlin, 1837) to have been formed in the following manner. The pupils of Dositheus, or other boys who made use of the Greek as a theme for re-translation, were accustomed as an exercise to place the words of the original text out of their natural order under the corresponding words of the Greek translation. The manuscripts of Dositheus were in fact specimens of a kind of ancient converse of modern Hamiltonian school-books. Proceeding on this idea, Lachmann has attempted, and on the whole with success, out of the disjointed Latin, to restore the original. The author of the fragment is unknown. Schilling, against the probable inference to be derived from internal evidence, supposes it to have been a compilation from several jurists, and

Law. in this opinion is followed by Zimmern. It has, without ground, been attributed to Ulpian; and as Dositheus himself calls the work *Regulæ*, it is supposed by Lachmann to have been an extract from *Pauli Regularum Lib. vii.* The Latin text was first published at Paris in 1573 by Pithæus, at the end of his edition of the *Collatio Legg. Mos. et Rom.*; the Greek and Latin together were first published by Röver (Lug. Bat. 1739). In the Berlin *Jus Civ. Ante-Just.*, the text, which in many books is stated to have been revised by F. A. Biener, was really edited by Beck. There are able observations on this fragment by Cujas (*Obs.* xiii. 31), by Valkenaer (*Miscell. Obs.* tom. x. p. 108), and by Schilling (*Diss. crit. de fragmento juris Rom. Dositheano*, Lips. 1819).

Divi Hadri- (6.) The same third book of Dositheus contains the
ani Senten- *Divi Hadriani sententiæ et epistolæ*, a collection of
tiæ et Epis- legal anecdotes and opinions of little value. It is the
tolæ. first extract in the *ἐπιτηνέματα*; and between it and the fragment concerning manumissions is inserted the genealogy of Hyginus. A complete edition of the third book of Dositheus was given by Böcking (Bonn, 1832).

Consultatio (7.) The *Consultatio veteris jureconsulti* is the
veteris work of an unknown lawyer, who probably lived
jurecon- shortly before the time when Justinian's compilations
sulti. were made, as he does not cite them, though he cites the Gregorian, Hermogenian and Theodosian codes. It really consists of four consultations, but the first consultation branching into three points concerning pacts, has occasioned the whole to be sometimes called *Consultatio veteris jureconsulti de pactis*. It was first edited by Cujas, in 1577, at the commencement of his own *Consultationes*. It appears in the *Jurisp. Ante-J.* of Schulting. In the Berlin *Jus Civ. Ante-J.* it is edited by Biener, and in the Bonn *Corp. Jur. Ante-J.* by Puggé.

Collatio Le- (8.) The *Collatio legum Mosaicarum et Romana-*
gum Mosai- *rum* is, like the *Consultatio*, written by an unknown
curum et author, who probably lived at the end of the fifth or
Romana- the beginning of the sixth century. It has been at-
rum. tributed without foundation to Licinius Rufinus, but internal evidence proves that the author was posterior to that Licinius Rufinus, at least, who was a jurist contemporary with Paulus. It is valuable for its literal citations from Gaius, Papinian, Ulpian, Paulus and Modestinus, as well as from the three codes which preceded the compilations of Justinian. It is sometimes called *Lex Dei*, from the words which commence a sentence at the beginning of the manuscripts of the work. The first edition is that of Pithæus (Paris, 1573). Of the many subsequent editions, the best beyond comparison is that of Blume (8vo. Bonn, 1833), which is the basis of the edition given in the Bonn *Corp. Jur. Ante-J.* The author was either a Jew or a Christian,—more probably the latter. His object in comparing the Mosaic and Roman systems of law appears to have been to furnish Christians and Jews with an apology for the Roman system, and to recommend the Mosaic system to the Pagans.

The Insti- (9.) Of all the discoveries recently made, none has
tutes of been so valuable, and none has excited so much at-
Gaius. tention, as that of the *Institutes* of Gaius. A corrupt and mutilated abridgment of these *Institutes* had been preserved in the *Breviarium Aniani*, but it was reserved for modern times to decypher a manuscript of the original work.

It was a common practice in the middle ages, to

Law. wash out the relics of antiquity, in order to economize the parchment on which they were written. When ing alone would not expunge the writing,—as often happened in the case of manuscripts written on the once hairy side of the parchment,—the characters were further scratched out with a knife. A father of the church sometimes covered the pages which had before contained the works of some profane dramatist. Not unfrequently the parchment was a second time submitted to the same treatment. The father, who had supplanted the dramatist, was himself washed and rubbed out, in order to give place to some scholastic doctor

In the Library of the Chapter at Verona is a *codex* formerly numbered xv., but now xiii., containing a manuscript of the letters of St. Jerome (*Hieronymus*), written over an older manuscript. Nearly one-fourth part of the *codex* was *bis rescriptus*, and, where this was the case, it seems that St. Jerome had also been the second occupant. It has been stated, we know not on what authority, that the letters of St. Jerome had been edited from this very manuscript, without any notice having been taken of the original purpose to which the parchment had been applied. The manuscript first written on the parchment consisted of 251 pages, and each page of 24 lines. It is a remarkable fact, that one leaf, or two pages, 235 and 236, concerning prescriptions and interdicts, had been detached from the rest of the manuscript, and escaped being overlaid by St. Jerome. These two pages had been found in the Library of Verona, before the year 1732, by the celebrated Scipio Maffei. He alludes to them in his *Verona Illustrata*, Parte terza, c. 7, p. 464 (Verona, 1732). In his *Istoria Teologica* (Trento, fol. 1742), p. 90, *et seq.*, the greater part of the text which they contain is printed. He gave a fac-simile of part of the writing in plate iii. cut x., subjoined to his *Istoria Teologica*, and part of this fac-simile was republished, not very accurately, in the *Nouveau Traité de Diplomatie* (Paris, 1757, see tom. iii. p. 208, tab. 46). Maffei had observed the correspondence between the fragment he published and the 15th title of the 4th book of Justinian's *Institutes*; but, instead of recognizing Gaius, whose text was the ground-work of Justinian's work, he supposed that the leaf he had found was part of an interpretation or compendium of Justinian's *Institutes* made by some later jurisconsult.—To Maffei, however, belongs the credit of having first given to the world two pages of the genuine Gaius.

It had not escaped the notice of Maffei that the manuscript of the letters of St. Jerome was a *codex rescriptus*.—This appears by his remarks in the catalogue of the Library, but he did not know what the subject of the obliterated writing was, and was not aware of the connexion between that manuscript and the detached leaf which had drawn his attention.

The fragment concerning Interdicts, published by Maffei, had not been unobserved by the learned Haubold, "*cujus ingentem eruditionem nihil fere solebat fugere.*" He determined to recall it to the memory of German jurists, and prepared an essay for that purpose, which was published at Leipsic in 1816, under the title *Notitia fragmenti Veronensis de Interdictis*, and is to be found in his collected *Opuscula*, tom. ii., p. 327-46.

By chance, while the *Essay* of Haubold was in

Law.

preparation, but not yet published, in the year 1816, Niebuhr was despatched to Rome by the King of Prussia, as Minister to the Apostolic See. On his way, he spent the greater part of two days in examining the Cathedral Library of Verona.—Whether he was induced to make this examination by previously excited curiosity concerning Maffei's fragment, we have not been able to ascertain; but certain it is that he made wonderfully good use of his limited time. He copied, fully and accurately, the fragment concerning interdicts and prescriptions, which he did not hesitate to ascribe to its real author, Gaius.—He also copied the manuscript of a fragment *de jure fisci* (of which we shall presently speak), and by means of the infusion of nut-galls, he was able to decypher the 97th leaf of the obliterated writing of *codex xiii.*, which he at once recognized as an important work of a most ancient jurisconsult, whom at first he supposed to be Ulpian. The fruit of his researches he communicated by letter to Savigny, by whom they were printed in the 3rd volume of the *Zeitschrift*. Savigny added a learned and acute commentary of his own, and put forward the felicitous conjecture, amply verified in the sequel, that the ancient text of *codex xiii.* contained the genuine *Institutes* of Gaius, and that the fragment concerning prescriptions and interdicts had formerly been a part of that *codex*.—The fame of this discovery soon spread among the jurists of the continent. Hugo, in particular, exerted himself in turning the attention of the learned to the subject, and pledged himself that the manuscript would amply repay the labour of decyphering: accordingly, in May, 1817, the Royal Academy of Berlin despatched to Verona two distinguished scholars, Goeschen and Bekker, charged with the task of transcribing the manuscript. Bekker was prevented by other occupations from accomplishing the task, and departed for Milan before the end of July; but his place was supplied by Bethmann-Hollweg, who, from the deep interest he felt in the subject, volunteered his valuable services, and greatly assisted Goeschen. The difficulty of transcription was excessive. The original manuscript, according to the opinion of the celebrated palæographer, Kopp, as stated in the 4th volume of Savigny's *Journal*, was anterior to Justinian's legal reforms. The scribe, like the majority of legal writers in our own country, at the present day, employed a great variety of contractions, and words were often expressed by initial letters. The old order of the leaves was much deranged.—There were very few pages where the parchment had not been written over: in 60 pages, it was *bis re-scriptus*, and the new writing was in general directly over the old. In order to prepare the parchment, it had been washed, apparently bleached in the sun, and in some parts scraped with a knife. Various chemical re-agents were tried in order to render the ancient characters again legible. Infusion of nut-galls succeeded the best. Notwithstanding these difficulties, by far the greater portion of the *Institutes* of Gaius has been preserved to us. Probably not one-tenth of the whole work is wanting. It is true that certain parts of the extant leaves resisted all attempts at decyphering, and that three leaves are missing, *viz.*:—1st. The leaf following p. 80, of which the argument may be collected from the Gothic epitome. 2nd. The leaf following p. 126, and commencing the third book. The whole contents of this leaf have been luckily pre-

served in the ancient extract, made by the author of the *Collatio*, before described. 3rd. The leaf following p. 194. The loss of this leaf is very tantalizing, for it doubtless contained some particulars relative to the old *legis actiones*, which we are left without any means of supplying. A few of the gaps which are occasioned by the impossibility of decyphering are also very lamentable, for they occur in the most obscure parts of the work,—in passages where the curiosity of the antiquary is raised highest,—and all the ingenuity of conjecture, possessed by the ablest critics, has been unable satisfactorily to fill them up.

With scrupulous accuracy and consummate ability did Goeschen and Hollweg finish their irksome and difficult labour. In 1819, the first printed sheet of the volume appeared; but not until 1821 was the first complete edition of the work brought out by Goeschen. Its appearance excited an unusual sensation among the jurists of the continent. Every copy was soon eagerly bought. It was considered to form an era in the study of Roman law. It was found to elucidate doubts and clear up difficulties before regarded as hopeless. By the true explanations it afforded, many an ingeniously constructed theory was demolished. It was felt that there was something unique and most remarkable in this resuscitation. Modern jurists were thus suddenly placed upon a vantage ground, from which they looked down upon their less fortunate predecessors. They blessed their stars, and thought it luxury to be admitted to a pure spring of knowledge, for many previous ages untasted and unknown.

A new edition was loudly called for, and in 1824, the learned Bluhme (as his name is generally written), or Blume (as he writes himself), made a fresh collation of *codex xiii.*, and the result of his renewed examination was given to the world by Goeschen, in the celebrated edition of 1824. An improved reprint of this edition, by Lachmann, was published in 1842, the editor having completed a critical revision, which had been interrupted by the death of Goeschen.

The civilians of the continent have, from the first publication of Gaius, laboured assiduously in interpreting the text, in composing dissertations on the doctrines contained in it, and in conjectural supply of the *lacunæ*; but no edition of the whole work with a good commentary has yet appeared. Among the most valuable productions to which Gaius has given birth, we would mention Gans' *Scolien zum Gaius* (Berlin, 1821), Dirksen's remarks in his *Versuche zur Kritik*, &c. (Leipz. 1823, pp. 104–136), Heffter's edition of the 4th book, with commentary, 4to. (Berlin, 1827), and Huschke's observations on Gaius in the first volume of his *Studien des Römischen Rechts* (Breslau, 1830). Klenze and Böcking's *Gaii et Justiniani Institutiones*, 4to. (Berlin, 1829), is a useful book. The texts of the two elementary works are there placed side by side, but Gaius is made to yield to the order adopted by Justinian. Among the latest editions of Gaius are that of Böcking (Bonn, 1841), and that of Lachmann, 8vo. and 4to. (Bonn, 1841). Lachmann's edition, in 4to. form, is now the first part of the Bonn *Corpus Juris Ante-J.* This, however, is distinct from the *new edition of the edition of 1824*, which we before mentioned. All the copies of an edition of the entire work by Heffter, which was originally intended to form the first part of the Bonn *Corp. Jur. Ante-J.*, have been long since exhausted.

Law.

Law

This account of the discovery of Gaius has been principally compiled from the well known prefaces prefixed to Goeschen's first and second editions. There are a few errors in the article relating to the same subject in the 48th volume of the *Edinburgh Review*, p. 381. &c. The bantering doubts which are thrown out by the critic (p. 385) as to the authenticity of the discovery were successful in provoking the ire of some matter-of-fact Germans, who looked upon them as serious.—(See Hugo's *R. R. G.*, 11th edition, p. 22, n. 23.) The authenticity of the *Institutes* of Gaius is beyond dispute. This is clear from internal evidence, which would prove a forger to have possessed miraculous knowledge and sagacity. The work agrees with the *Institutes* of Justinian (which were derived from it), is the manifest source of the Gothic epitome, and contains all the passages cited from Gaius in the *Pandects*, in the *Collatio*, by Boethius and by Priscian.

Gaius wrote under the Antonines, in the most flourishing period of Roman jurisprudence; and his *Institutes*, as they were a popular manual at Rome, are perhaps to the modern student the best initiation into the civil law, especially if they are read along with the *Institutes* of Justinian and the *Paraphrase* of Theophilus. The method of Gaius is based on the celebrated threefold division of law, "*Omne jus quo utimur, vel ad personas pertinet, vel ad res, vel ad actiones.*"—It is necessary to observe, that he treats rather of the *dynamics* than of the *statics* of law—rather of those events or *forces* by which classes of rights begin, are modified or terminate, than of those rights and duties which accompany a given *stationary* legal relation.—Thus, in treating of the *jus quod ad personas pertinet*, when he comes to the *patria potestas*, it is not his object to explain the mutual rights and duties of parents and children, but to point out the cases and events in which those rights and duties arise or cease.

Fragmentum de Jure Fisci.

(10.) The "*fragmentum de Jure Fisci*" is derived from a manuscript of two leaves in the Library at Verona. The characters, though not written over, were faded and difficult to decypher. The two leaves were observed by Maffei, who gave some extracts from them in his *Istoria Teologica*, in conjunction with the extracts from the detached leaf of Gaius; but, as we have before stated, a complete copy was first taken by Niebuhr. The best edition of the text is that of Böcking, with critical notes, in *Ulpiani Fragmenta* (Bonn, 1836). It is generally supposed to be a fragment, not of Ulpian, but of Paulus, who wrote two books "*de jure fisci.*" A passage of the fragment (§ 19) is repeated almost verbatim, but in a different connexion, in another work of Paulus, *Liber Quintus Sententiarum*, as appears by an extract in the *Pandects* from the latter book (L. 45, § 3, D. de Jure Fisci, (xlix. 14)).

Fragmenta Juris Romani Vaticana.

(11.) The Vatican fragments were taken by Mai from a manuscript of the *Collationes* of Cassianus in the Vatican Library. Twenty-eight leaves of this manuscript were observed to be *folia rescripta*, and upon examination it was found that the characters first written and covered by the work of Cassianus belonged to a collection of extracts from constitutions and juridical writings. Of this collection seven titles are imperfectly preserved, and were first published by Mai, at Rome, in 1823. Of subsequent editions, the best are those of Buchholz (Regiomontani, 1828, with explanatory notes, and of Bethmann-Hollweg (Bonn,

1833), with critical notes. The author of the collection, which was probably made a short time before the compilation of the Theodosian code, appears to have had a practical end in view, viz. the reduction into a convenient size of sources commonly quoted before the courts. He gives extracts from Papinian, Ulpian, and Paulus; and in those extracts Celsus, Julianus and Pomponius are frequently cited. On several points, especially the doctrines of *dos*, *ususfructus* and *donationes*, the Vatican fragments throw important light. How much they contribute to our knowledge of Roman law is well shown by G. Bruns, in a little work under the title *Quid conferant Vaticana Fragmenta ad melius cognoscendum Jus Romanum* (Tubingæ, 1842).

(12.) A Greek fragment, *de Obligationum Causis et Solutione*, first discovered by Mai, was reprinted with notes by Haubold (Leipz. 1817), and may be found in the second volume of Haubold's collected *Opuscula*, p. 394. It elucidates the *stipulatio Aquiliana*, the form of which is given and well explained in *Brissonius de Formulis*, lib. vi., c. 194.

Before we proceed to enumerate some less pure sources, we cannot avoid expressing a wish that some of the many palimpsests or *codices rescripti* which exist in the British Museum were examined by competent scholars. The continental jurists who have been deputed to explore Great Britain in search of legal treasures seem not to have been acquainted with the existence of such palimpsests, nor do they seem to have investigated the manuscripts belonging to our Inns of Court.

B a. To the head *B a*, consisting of the separate works and fragments of works of single jurists, preserved in collections made by public authority, may be referred (1.) the epitome of Gaius; (2.) the fragment of *Pauli Sententia*; (3.) a fragment of Papinian. All these are preserved in the *Breviarium Aniani*.

B b. To the class *B b* belong (4.) the *Codex Gregorianus*; (5.) the *Codex Hermogenianus*; (6.) the *Codex Theodosianus*; (7.) the *Ante-Justinianean Novells*; (8.) *Edictum Theodorici*; (9.) *Edictum Athalarici*; (10.) *Lex Romana Burgundiorum*; (11.) *Institutio Gregoriana*.

To the head *B b* might be referred the *Breviarium Aniani*, as it was a law-book made by public authority; but it is itself a collection not only of private legal writings sanctioned by public authority, but of abstracts of former collections. The head *B b* might hence be sub-divided into two classes: the first consisting of those codes and collections, or parts of codes and collections, which have come down to us separately and independently; the second, of those which are only known from their preservation in the *Breviarium Aniani*.

Of this compilation, we shall now give some account before we proceed to the description of the several sources enumerated under the heads *B a* and *B b*.

When the Western Empire submitted to Germanic rule, the Roman law was still allowed to retain its force by the side of a newly introduced Germanic jurisprudence. The *Lex Romana*, as it was barbarously called, remained the law of the subjugated Romans, while the *barbari*, as the Germans were proud to be styled, continued to live under their own Teutonic institutions. Hence arose various difficulties. In the case of contracts between Germans and Romans, or crimes committed by a man of one race against a man of the other, which system was to prevail? These

Law.

Fragmentum de Obligationum Causis.

Private writings preserved in Compilations made by public authority. Collections or Codes.

Law. questions were differently decided in the different kingdoms of the Western Empire, and the reader may be referred to Savigny's *History of the Roman Law in the Middle Ages* for a full elucidation of the anomalous system of *personal laws*.

In the Westgothic kingdom, which was established in Spain and a part of Gaul, it was found necessary, during the reign of Alaric II. (484--507), to make a collection of such sources of Roman law as were to be recognized for the future, in regulating the rights and duties of the subjugated Roman provincials. The collection was made, and, in the year 506, copies of it were sent to the higher magistrates, with a *com-mo-nitorium*, in which it is stated that the duty of publication was intrusted to Goiaric, the *comes palatii*; while the duty of authenticating true copies with his signature was left to Anianus.—Many have supposed, without sufficient reason, that Anianus was the author of the whole compendium, and hence it has received, in comparatively modern times, the name *Breviarium Aniani*, a name which first appears in the edition of Tilius (Paris, 1550). It has also sometimes been called *Breviarium Alaricianum*, or simply *Breviarium*, or *Lex Romana*, or (from the *Codex Theodosianus*, which is its first and chief ingredient) *Lex Theodosii*. By Anianus himself, in his subscription, it is termed "*Codex de Theodosiani legibus, atque sententiis juris vel diversis libris electus*." There are considerable variances in the manuscripts of the *Breviarium*. The oldest manuscript is that which is now at Munich. One of the best belongs to Sir T. Phillipps, bart., the owner of the celebrated *Bibliotheca Phillippica*, of Middlehill.—The first complete edition of the *Breviarium* (with an Appendix of other works relating to Roman law) was given by Sichert (Basil, 1528). Of subsequent editors, Cujas deserves especial notice. This Westgothic collection consists of an abstract of the Theodosian Code, in 16 books, followed by a collection of later constitutions called *Novells*. This part of the collection has been called *leges*, while the name *jus* has been given to the part which follows, consisting of the epitome of Gaius, the extract from the *Sententiæ* of Paulus, the extract from the Gregorian and Hermogenian Codes, and the fragment of Papinian. A barbarous interpretation (*interpretatio* or *scintilla*) is subjoined to the text of each work, with the exception of the epitome of Gaius, whose *Institutes* are so remodelled in barbarous fashion, and so mutilated, as not to want an *interpretatio*. The text of Gaius, the oldest author employed, was so full of antiquated law, that, in its original state, it would have been unsuitable to the character of the times. The *interpretatio* was made by the original compilers. It sometimes paraphrases, sometimes modifies the law contained in the text, and sometimes refers to passages in other parts of the compilation. The texts themselves are occasionally garbled and corrupted.

The *Breviarium*, with its corrupt *interpretatio*, has been itself the theme of a still more corrupt *interpretatio* of the second order, in base Italian Latin. Those who are anxious to see to what extent an ancient monument may be defaced and deformed, may consult the *Lex Romana Utinensis*, at the end of the 4th volume of Canciani's *Leges Barbarorum*.*

Law. The *Westgothic Breviarium* must not be confounded with the *Lex Wisigothorum*, which is a code, not of Roman but Germanic Law.

We return to the sources which we have separately enumerated.

(1.) The Westgothic epitome of Gaius, imperfect and disfigured as it is, is now of little use since the discovery of the genuine *Institutes*, except for the purpose of understanding ancient quotations, in which it is referred to, and of assisting in the restoration of the valuable original. It has been ably commented upon by Schulting (*Jurisp. Ante-J.* p. 1—186), and by Meerman (*Thesaurus*, tom. vii. p. 669—686). It is edited by Haubold in the *Berlin Jus. Civ. Ante-J.* and by Böcking in the *Bonn Corp. Jur. Ante-J.* It consists, according to the ordinary division, of two books, and contains no abstract of the 4th book of the genuine Gaius, concerning actions.

(2.) The famous jurisconsult, Julius Paulus, wrote, in the reign of Caracalla, a treatise entitled *Sententiæ Pauli ad filium Libri V.*, in which he followed the order observed by the commentators upon the edict, while, in his usual succinct style, he gave a collection of practical legal propositions established by custom. Great part of this work was adopted, with some curtailments affecting the sense, and perhaps some alteration of the text, by the Westgothic compilers. The work, as it has been preserved to us in the *Breviarium*, is usually called *Pauli Sententiæ Receptæ*. It has been published, sometimes in its Westgothic shape, sometimes with the insertion of additional passages from the *Sententiæ* of Paulus, which are to be found in the *Pandects* and other sources. The first edition is that of Paris, 1525. The text and *interpretatio* are given in Schulting's *Jur. Ante-J.* with notes by the editor, and a selection from those of Rittershusius and Cujas, and in Meerman's *Thesaurus*, tom. vii., with the commentary of Petrus Faber. The text, edited by Biener, without the *interpretatio*, appears in the *Berlin Jus. Civ. Ante-J.* The last edition is that of Arndts, with a mass of various readings by Hänel, in the *Bonn Corp. Jur. Ante-J.*

(3.) The only fragment of Papinian preserved in the *Breviarium* is an unimportant passage "*e libro primo Responsorum, sub titulo, De Pactis inter virum et uxorem*." (Schult. *Jur. Ante-J.* p. 810.)

(4.) The *Codex Gregorianus*, or *Corpus Gregoriani* (as it has been called from its compiler Gregorianus), was a collection containing the constitutions of Roman Emperors, arranged in books, and titles with rubrics, according to the order of subjects adopted by writers on the edict. Nothing is known of the compiler. Whether his name was Gregorianus or Gregorius has been doubted, though the better opinion is in favour of the longer name. The number of books which this code contained is unknown. The 13th book is cited in the Vatican fragments, and the 14th (if Blume's reading be correct) in the *Collatio*, tit. i. c. 8. The oldest constitution which can be referred to it with certainty, is one of Septimius Severus, of the year 196 p.c.; the latest, one of Diocletian and Maximinian, of the year 295. It is not unlikely that the constitutions contained in this code have been for the most part

* The following may be taken as a favourable specimen. "Incipit Liber Gaii I. Interpr. Ingenuorum statum unum est.

Nam liberorum vero trea genera sunt. Ingenui vero sunt, qui de ingenuos parentes nascuntur. Liberti sunt, sicut jam diximus, trea genera: hoc est, cive Romanum, et Latini et Divicicii."

Law.

embodied in other later collections of constitutions, viz.:—those of Theodosius and Justinian, and that in this way we really possess a majority of them; but the Westgothic *Lex Romana* preserves only 13 titles of the *Codex Gregorianus*, containing about 22 constitutions, and in some manuscripts a few more by way of Appendix. From citations in other sources, we are able to pronounce without doubt of some other constitutions that they were included in this collection. Upon the whole, we are not able to refer to the *Codex Gregorianus* more than 70 constitutions, though it originally contained some thousands. The best critical edition is that of Hänel, in the *Bonn Corp. Jur. Ante-J.*

Codex Hermogenianus.

(5.) Of the author of the *Codex Hermogenianus* nothing is known beyond the name Hermogenianus. By some, he has been identified with the Hermogenianus who was the author of *Libri Epitomarum*, from which extracts are made in the *Pandects*. The *Breviarium* preserves but two titles of this collection, each containing one constitution. It does not seem to have been divided into books, for it is always quoted by titles only, and it is generally believed to have been a supplement to the *Codex Gregorianus*, though we find, from an assertion in *Coll. Leg. Mos. et Rom.* vi. 5, that one constitution of Diocletian, inserted in the *Codex Hermogenianus* with the date 291, existed in the *Codex Gregorianus*, with the date 290. In the *Consultatio*, c. 9, seven constitutions of Valens and Valentinian, about the date 364 and 365, are ascribed to this collection; but critics have generally believed that the *Codex Hermogenianus* was of earlier date—that, in fact, it was not carried down later than the reign of Constantine—and that there must be some error in the reading of the text in the *Consultatio*. Hänel, the latest editor, has not inserted these seven constitutions in his text. This and the preceding code are usually mentioned together. Both were probably the work of private individuals; but we are told in the *interpretatio* appended to tit. 4 of the 1st book of the *Theodosian Code*, that their authenticity was confirmed by imperial sanction. The constitutions of the emperors anterior to Constantine, inasmuch as their contents were often either originally derived from, or subsequently embodied in, the writings of jurisconsults, came afterwards to be classed not as *leges* but as *jus*; a distinction which would be paralleled in our English system if our oldest Acts of Parliament were classed not as statute, but as common law. This accounts for the fact already mentioned, that the *Codex Gregorianus* and *Codex Hermogenianus* are included in the *Breviarium* under the head of *Jus*.

Codex Theodosianus.

(6.) After the reign of Constantine, the imperial constitutions began greatly to multiply, and the writings of jurisconsults had already extended to a formidable bulk. To remedy this inconvenience, Theodosius the younger, emperor of the East, formed the design of making a code like the Gregorian and Hermogenian, and supplementary to them. The code was to contain public and general constitutions from Constantine onward. He also entertained a project of compiling a work on the Civil Law of Rome from the writings of the jurisconsults and the constitutions anterior to Constantine. The latter project was dropped, but the former design was carried into execution, and very recent discoveries have elicited some hitherto unknown historical particulars respecting its completion. A commission of eight or nine members was appointed

Law.

in 429 to compile a code of constitutions according to certain instructions, among which was a provision that conflicting clauses were not to be altered or omitted, but the dates were in all cases to be carefully appended, in order that, in case of collision, it might be known what law was to prevail. This commission did not accomplish the work assigned to it; and another, consisting of 16 members, was appointed in 435, with the ampler power of removing what was superfluous, adding what was necessary, changing what was doubtful, and correcting what was inconsistent. The code was completed by the second commission in 438, was first promulgated as law in the Eastern Empire, and in the course of the same year was transmitted to Valentinian III. and confirmed as law for the Western Empire. The *Gesta in Senatu*, an account of the proceedings in the Roman senate when the code was formally submitted to them for approval, is a remarkable and in some parts enigmatic document lately brought to light among the discoveries of Clossius.

The Theodosian code consists of 16 books, which are divided into titles, and the titles subdivided into sections or laws. It is usually referred to thus: *L. 5, C. Th. de Scenicis* (xv. 7). This signifies the fifth law of the title of the Theodosian code, with the rubric *De Scenicis*; and in order to prevent the necessity of consulting an alphabetical index of rubrics of titles, the figures xv. 7 are intended to denote that the title with the rubric *de Scenicis* is the 7th of the 15th book. The reference would indeed be sufficient thus: *L. 5, C. Th. de Scenicis*; or thus: *L. 5, C. Th. xv. 7*; but it is better to give the name as well as the number of the title; as an English lawyer, in quoting a case, gives the names of the parties as well as the volume and page of the reporter. A more simple, but less usual mode of reference is, *C. Th. lib. xv. tit. 7, l. 5*; or *C. Th. xv., 7, 5*.

In classing the constitutions under titles, the compilers, in pursuance of their powers and instructions, disposed chronologically under one title those constitutions or parts of constitutions which were connected in subject. The first V. Books are arranged according to the order of the commentators on the edict, and contain the greater part of the constitutions which relate to private law. Books VI.—VIII. are principally occupied with constitutional and administrative regulations. The IXth contains criminal law; the Xth and XIth financial law, to which are appended some matters connected with legal procedure; XII.—XV. treat of the constitution and administration of towns and other corporations; and the XVIth Book is devoted to ecclesiastical rules. The whole is a vast collection of the highest importance and interest to the historian and antiquary, as well as the lawyer.

The 16 books of the Theodosian Code were at first known to the moderns only through the imperfect abstract and *interpretatio* of the *Breviarium*. In this shape it appeared in the editions of Ægidius (Antwerp, 1517), and of Sichard (Basil, 1528). But there were incomplete manuscripts of the genuine Theodosian Code in existence, and many of the manuscripts of the *Breviarium* were interpolated from the original source. Availing himself of such aids, Du Tillet gave, in 1550, a mixed edition in two parts, of which the first contained eight books, according to the Gothic epitome; the second, the remaining eight books—the 16th in a very imperfect condition—according to the genuine code.

Modern literary history of the *Codex Theodosianus*.

Law.

In the editions of Cujas (the first of which appeared at Lyons in 1566), three more books (vi.-viii.) of the genuine code were added from divers sources, and the 16th book completed; but the first five were still drawn from the *Breviarium*, and such was substantially the state in which, until very recently, the text of the Theodosian Code remained.

After Cujas, the labours of that most learned and judicious critic and scholar, Jac. Godefroi, supplied an invaluable commentary, which was first published after the death of the author by Marville, in six volumes, folio, (Lugd. 1665). A second and improved edition of the *Codex Theodosianus*, with the commentary of Godefroi, was given by Ritter (Lipsiæ, 1736-45); and there have been reprints of Ritter's edition at Mantua and Venice. One of the editions of the Theodosian Code, with Godefroi's commentary, is an indispensable adjunct to the library of every Roman lawyer. The text was not materially altered by Godefroi, who added but three genuine constitutions.

In the present century, further discoveries have been made. A few constitutions have been brought to light by Hänel and Mai. In 1823 Clossius gave to the world a list of the titles in the *Breviarium*, the *Gesta Senatus*, and a constitution addressed to the *constitutionarii* (i. e. the officers appointed to authenticate the copies). In addition to these, which serve to illustrate the code, but form no part of its contents, he published no fewer than 79 new genuine constitutions, from a manuscript of the *Breviarium* which he found in the Ambrosian Library at Milan, and which fortunately was interpolated from the original source. In the same year Peyron published 85 new constitutions, decyphered from some palimpsest leaves, contained in a manuscript volume* in the Library of the University at Turin. The first writing on the leaves was part of the genuine code, over which had been written a narrative of the exploits of Alexander the Great. 16 leaves out of the 30 decyphered by Peyron only furnished new readings for constitutions which were already known.

It seems that there were 14 other palimpsest leaves which Peyron had laid by in a book in his own library, and had forgotten to take out again. These were found in 1835 or 1836 by Baudi de Vesme. They give 22 new constitutions, besides various readings. The various readings were communicated by De Vesme to Hänel, who, with enormous labour, has completed a new and very valuable edition of the text of the Theodosian Code for the *Bonn Corp. Jur. Ante-J.* The publication of the 22 new constitutions is said to be reserved for an edition to be brought out by De Vesme himself.

Notwithstanding these acquisitions, which have re-

* Peyron maintains that this volume had formed a part of the library of the monastery at Bobbio, which was founded by St. Columbanus, a native of Ireland, about the beginning of the seventh century. Dr. Irving, in his *Introduction*, p. 49, quotes a statement of Peyron which we think it worth while to transcribe, in the hope of drawing the attention of British and Irish philologists to the Latin books in Saxon characters, and with Saxon glosses, originally belonging to the library at Bobbio, and seen by Peyron in the libraries at Milan and Turin. *Ad primam hanc ætatem pertinet primus bibliothecæ fundus, veneranda illa scilicet codicum supellex a D. Columbano ejusque discipulis Bobium comportata. Fidi in Ambrosiana, atque Taurinensis habet, libros Latinos Saxonis litteris descriptos, glossisque Saxonis illustratos: hos pro varia eorum antiquitate vel a D. Columbano ex Hibernia, vel a Caniano ex Scotia, aliisque Anglicis Monachis allatos autumo.*

stored to us a considerable portion of the first five genuine books, the Theodosian Code is still far from perfect. Hänel calculates that the first five books, which are the only books still incomplete, contained 1000 or 1200 constitutions; that of these between 600 and 700 are wanting; that of those which are wanting, about 350 are wholly lost, while the rest are to be found in the Code of Justinian. The existing constitutions in the 16 books amount to about 2800.

An excellent edition of the first five books, including all the modern discoveries, except those of De Vesme, and enriched with explanatory as well as critical notes, was published by Wenck, 8vo. (Lips. 1825.)

7. The formation of a code places but a slight check upon further legislation. New constitutions (*Novellæ constitutiones*, or *Novellæ*) were promulgated in the Eastern and in the Western Empire. The necessity of this was foreseen by Theodosius the Younger and Valentinian; and, in order to preserve a legal unity, it was arranged that the *Novellæ*, applicable to the circumstances of both empires, which should be published in the one, should, as soon as conveniently might be, be sent to, and adopted in, the other. In pursuance of this arrangement, *Novellæ* of Theodosius the Younger, and of his successor Marcian, were sent to and adopted by Valentinian. After the death of Valentinian in 455, the connexion between the two empires became more loose, but some *Novellæ* of Leo I. were sent to the West in the reign of Anthemius, whom Leo had helped to the throne. The *Novellæ* of the Eastern Emperors Theodosius, Marcianus, and Leo, were not only sent to the West, but adopted there practically, and were inserted in the Western collections.

On the other hand, Valentinian sent constitutions from the West, but it has been doubted (1 Puchta, *Inst.* 655) whether they were ever practically adopted in the East, and whether Majorianus, Severus, and Anthemius went so far as even to send their *Novellæ* into the Eastern Empire, although still, as before, they bore, for form's sake, the names of the two contemporary Cæsars at their head. Certain it is that the compilers of Justinian's Code made no use of the *Novellæ* either of Valentinian III., or of any other succeeding emperor of the West.

Six books of Ante-Justinianean *Novellæ*, divided into titles with rubrics, are appended to Jac. Godefroi's edition of the Theodosian Code; but the 6th book, containing the *Novellæ* of Anthemius, is deficient in most of the manuscripts of the *Breviarium*. Five constitutions of Theodosius and Valentinian, not inserted in previous printed editions, were found in the Ottobonian manuscript, which now belongs to the Vatican Library, and were published by Zirardini (Faventia, 1766), and by Amaduzzi (Romæ, 1767). The last edition is that of Beck in the *Berlin Jus. Civ. Ante-J.* Hänel has undertaken to review the text for the *Bonn Corp. Jur. Ante-J.*

(8.) Odoacer, after having overturned the Empire of the West, and conquered Italy in 476, yielded in 493 to the arms of the Ostrogoths, who became masters of Italy.

It was principally to regulate the mixed legal relations between Romans and Ostrogoths that Theodoric the Great, in 500, published a set of rules based on the Roman, not the Gothic, law. It seems that, where express legislation was silent, the Roman law,

Law.

The Ante-Justinianean Novellæ.

Edictum Theodoric.

Law.

with some modifications introduced by practice, was suffered to prevail over the whole population in the kingdom of the Ostrogoths, although the jurisdiction, unless both parties were Romans, was committed to Gothic magistrates. The edict of Theodoric, though compiled principally out of imperial constitutions and the *Sententiæ* of Paulus, has not hitherto been inserted in collections of Roman law. It is to be found in the collections of Germanic law by Lindenbrog, Canciani, Georgisch, and Walter. The best edition is that of Rhon, *Commentatio ad Edictum Theodorici* (Halæ, 1816).

Edictum
Athalarici.

(9.) The short edict of Athalaric contains some further provisions directed against offences, and borrowed in part from Roman law. It is given in the 1st volume of Canciani, *Leges Barbarorum*, and in Manso, *Geschichte des Ostgothischen Reichs in Italien* (Breslau, 1824). See also Gretschel *ad Edict. Athalarici* (Lips., 1828).

Lex Roma-
na Burgun-
diorum.

(10.) Towards the middle of the 5th century the kingdom of the Burgundians was formed on the banks of the Rhone.

The *Lex Romana Burgundiorum* was compiled after the year 517, for the use of the Burgundian Romans, the Burgundian conquerors having already a similar code of their own called *Gundobada*. It is composed from the same sources as the Westgothic *Breviarium*, but follows the order of the *Gundobada*. It is a meagre compilation, consisting of only 46 titles.

In many manuscripts, this collection follows, without interval and without new title, the Westgothic *Breviarium* which ends with a fragment from *Papiniani lib. i. Responsorum*. To this circumstance is usually attributed the name *Papian*, by which the Burgundian *Lex Romana* is commonly known. In the manuscripts, *Papiani* is the almost invariable corruption of *Papiniani*; and Cujas is supposed to have mistaken the last portion of the *Breviarium* for the commencement of the ensuing treatise. We are not quite satisfied with this explanation, and doubt whether the name had not an earlier origin than the first edition of the *Papian* brought out by Cujas. In the edition of Cujas printed at Paris, 1586, the book is described as *Burgundionis J. C., qui Papiani Responsorum titulum præfert liber*. We think it likely that the Roman, as well as the Burgundian, law-book of the Burgundians had a distinct appellation. (See Savigny's *Zeitschrift*, vol. ix, p. 237, &c.)

The best, and the only separate, edition of the *Papian* is that of Barkow, *Lex Romana Burgundiorum*, (Gryphisw, 1826.)

Institutio
Gregoriana.

(11.) In the 9th volume of Savigny's *Zeitschrift*, Klenze published for the first time, from a manuscript of the *Breviarium* at Berlin, a work entitled *Institutio Gregoriana*. Its author and purpose are unknown. It contains not only extracts from the *Codex Gregorianus* (from which by some it has been supposed to derive its name), but from the *Theodosian Code*, from *Pauli Sententiæ*, and from a work of Papinian. It is later in date than the *Breviary* of Anianus, and it is doubtful whether it is an authorized, independent compilation.

Having now enumerated the principal sources of Ante-Justinian law, considered apart from the compilations of Justinian, it is proper to state that the three best known collections of those sources are, (1) Schulting's *Jurisprudentia Ante-Justiniana*;

(2) the Berlin *Jus Civile Ante-Justinianum* (to which Hugo promised a preface, which has never appeared); and (3) the still unfinished *Corpus Juris Ante-Justiniani*, now publishing at Bonn.

Of these, the first alone has a commentary, and the notes are so excellent that it is not likely to be ever superseded. It omits the *Theodosian Code* as being already pre-occupied by Jac. Godefroi.

The second contains the *Theodosian Code*, with the *Appendix of Novells*, but it omits throughout the Westgothic interpretations. It is still the best and most complete collection of texts, but it will be superseded in these respects by the third, which, when completed, will be a highly valuable work. The best separate editions of the sources, however, will always be found more agreeable to consult, and often, on account of their exegetical notes, more useful.

We have now to describe the separate contents of the Roman law, as it appeared in the compilations made under the direction of Justinian. The com-
pilations of
Justinian.

The idea of forming a collection of positive laws has been attributed to Pompey, to Cicero, and to Julius Cæsar. We have seen how far Theodosius the Younger carried his plan into effect, and we have considered the nature of the Roman legislation of three Germanic kingdoms, founded on the ruins of the Western empire. Justinian was more vast than all who had preceded him in his conception, and more successful in the complete execution of his plan. It seems to have been his intention to establish a perfect system of written legislation for all his dominions; and for this purpose to make two great collections, one of the imperial constitutions, the other of all that was valuable in the works of jurisconsults, who were now quoted at second-hand.

The history of Justinian's legislation has often been told, and our limits warn us to be brief in treating a subject where accurate information may be obtained in easily accessible channels.

The first work attempted by Justinian, as the most practical and the most pressing, was the collection of imperial constitutions. This he commenced in 528, the second year of his reign. The task was intrusted to 10 lawyers, among whom was the distinguished professor Theophilus. At their head was Tribonian, a man who was endowed with rare qualifications for such an appointment. He was himself deeply learned in law, and possessed in his library a matchless collection of legal sources. He had passed through many gradations of rank, knew mankind well, and was remarkable for energy and perseverance. "His genius," says Gibbon, "like that of Bacon, embraced as its own all the business and knowledge of the age." In compiling all that was useful in preceding constitutions, the commission was authorized to correct, to retrench, to consolidate, but not to make material alterations. The commissioners executed their task with excessive haste. The new code received the imperial sanction in April 529, but it was soon found to be incomplete, and was in the sequel entirely suppressed.

Soon after the completion of the first code, Tribonian was authorized to choose fellow-labourers to assist him in the other division of the undertaking,—a part of Justinian's plan, which the emperor justly regarded as the most difficult, but also the most important and the most glorious. In December, 530, sixteen commissioners were chosen to lay under contribution the works The Digest
or Pandects.

Law.

Law. of those jurists who had received from former emperors authoritative permission *jura condere*. They were to select all that was best, with permission to alter and interpolate, in order to accommodate their extracts to the circumstances of the time. Rapid was their progress. In little more than three years the immense compilation was complete, and on the 30th December, 529, was published with the imperial sanction. It comprehends upwards of 9000 extracts, in the selection of which the compilers made use of above 2000 different treatises. This extraordinary work has been blamed by men of divers views on divers accounts. Tribonian and his associates, regarding more practical utility than the curiosity of searchers into ancient law, did not scruple at times so to adulterate the extracts they made, that a theorizer in legal history might easily be misled if he trusted implicitly to their accuracy. Hence the *emblemata Triboniani* have been to many critics a fertile topic of reprehension. On the other hand, the complaints of Thibaut (*Inst. und Herm. des R. R.* § 88) are levelled against scientific rather than historical delinquencies. He saw that unity and system could result only from a single complete code of remodelled laws, and not from the lazy plan of two separate collections, made out of independent pre-existing writings; and though, from the circumstances of the time, Justinian was forced to adopt the latter alternative, it was unphilosophical to commence with the constitutions instead of the jurisconsults. Those principles which lie at the foundation of jurisprudence pervade the writings of the Roman lawyers, and their works are in reality more full of practical law than the constitutions to which occasional exigency gave birth. Then the arrangement of the *Pandects* sins against science. They are divided into seven parts or 50 books; the parts begin respectively with the 1st, 5th, 12th, 20th, 28th, 37th and 45th books. Each book is divided into titles with rubrics. The separate extracts under each title were not originally numbered, but the name of the author and a reference to his work were prefixed. In the general order of the books, and in the order of titles, the order of the edict, which was itself based upon the order of the twelve tables, was followed. But this arrangement was historical, not systematic. There is no *pars generalis*, no connected statement of first principles, no regular development of consequences. Leading maxims are introduced incidentally; and matters of the greatest moment, as the law of procedure, are scattered under divers heads,—here a bit and there a bit. The internal arrangement of the separate fragments of jurists under each title would appear at first sight to be completely fortuitous. It is neither chronological nor alphabetical, nor does it follow any rational train of thought depending on the subject treated of. Blume has elaborately expounded a theory which, though still rejected by Tigerström and others, seems to us to rest upon the foundation of facts, and must at least be something like the truth. No one can form any opinion of the merits of Blume's theory, without a careful examination of a great number of titles in the *Digest*. We can now do no more than state its general nature. He finds that the extracts under each title resolve themselves into three series,—that one series of adjoining extracts is taken from Commentaries on Sabinus; a second from Commentaries on the Edict,—and a third from Commentaries on Papinian. Hence he supposes that the

commission was divided into three sections, and that to each section was given a certain set of works to analyze and break up into extracts. Blume's celebrated Essay on the *Ordnung der Fragmenta in den Pandectentiteln*, is to be found in the 4th volume of Savigny's *Zeitschrift*. From the works of 35 jurists there are direct extracts in the *Pandects*. The jurists from whom extracts are made often cite other jurists, and there are four jurists from whom the *Pandects* contain pure or literal extracts at second-hand. The 39 jurists from whose works the *Pandects* contain literal extracts, whether directly or at second-hand, are often called the *classical jurists*, a name sometimes extended to all those jurists who lived not later than Justinian, and sometimes confined to Papinian, Paulus, Ulpian, Gaius, and Modestinus, upon whose works a peculiar authority in the courts was conferred by a constitution of Valentinian III. (*C. Th. lib. i. tit. 4, 5*). Extracts from Ulpian constitute about one-third of the *Pandects*; from Paulus, about one-sixth; from Papinian, about one-twelfth. In Hommel's *Palingenesia Pandectarum* the fragments of each jurist are collected and printed separately; an attempt is made to reanimate the man—to restore his individuality—by bringing together his dispersed limbs and scattered bones.

Justinian was desirous that the body of law compiled under his directions should be all in all, not only for practice, but for academical instruction. He forbade all commentary on his collections, and prohibited the citation of older writings. It is said that Napoleon exclaimed, when he saw the first commentary on the *Code Civil*, "*Mon Code est perdu!*" and Justinian seems to have been animated with the same spirit. He allowed no explanation save the comparison of parallel passages and the interpretation of single words. As the *Pandects* and the *Code* led far into detail, which could not be understood by beginners, it became necessary to compose an elementary work for students.

This task was assigned to Tribonian, in conjunction with Theophilus and Dorotheus, who were respectively professors in the two great schools of law at Constantinople and Berytus. The *Institutes* of Gaius were taken as the basis of the work, which was to be brought into harmony with the *Code* and the *Digest*, but other treatises were made use of in its formation. Hence there is an occasional incongruity in the compilation, from the employment of heterogeneous materials. For example, the discordant notions of Gaius and Ulpian on the *jus naturale* and the *jus gentium* are brought together, but refuse to blend in consistent union. It is divided into four books, arranged according to the principle adopted by Gaius.—Law treats of rights.—Differences of rights result from permanent differences in those who possess rights—the subjects of right—*persons*; and also from differences in that over which rights are exercised—the objects of right—*things*. Besides the modifications of right attributable to permanent differences in persons, and natural or conventional differences in things, there are transitory rights which arise from voluntary acts. Further, in order to redress any violation of those primary rights which alone would have to be considered, if men acted in obedience to law, the law establishes secondary rights—remedies for violation of right, and rights of action. In the *Institutes*, first is treated the *jus personarum*,—then follows the doctrine of *things*, so far as they are important in law. The law of obligations,

Law.

The *Institutes*.

Law. connected as they are with *incorporeal things*, follows; and at the end there is a very short notice of the law of actions, and of criminal law.

Codex Re-
petitæ
Prælec-
tionis.

L. Deci-
siones.

The *Institutes* received the imperial sanction, at the close of 533, on the same day with the *Pandects*.

“Man, and for ever!” exclaims Gibbon. Had it been possible to make law for ever fixed, and had the emperor’s workmen successfully accomplished the unchangeable petrification, the desire of Justinian’s heart would now have been fulfilled. There were many questions upon which the ancient jurists were divided. Under the early emperors these differences of opinion gave rise to permanent sects, nor were they afterwards entirely extinguished when party-spirit had yielded to independent eclecticism. The compilers of the *Pandects* had tacitly, by their selection of extracts, manifested their choice; but a Catholic doctrine, the great object of Justinian’s wishes, was not thus to be accomplished. In order to settle the orthodox legal creed, it became necessary for him to promulgate fifty decisions (*L. Decisiones*) on the most controverted points. Moreover, the imperfection and ambiguity of the existing law required to be remedied by further constitutions, of which a considerable number was issued during the three years occupied in the composition of the *Pandects*. Accordingly, immediately after the publication of the *Pandects*, orders were given for a revision (*repetita prælectio*) of the first code, which was to be purged from errors, and reinforced by the admission of the subsequent constitutions, including the fifty decisions. On the 15th November, 534, the new edition of the code came out; and to this new edition, in contradistinction to the former (which was now superseded and carefully suppressed), has been usually given the name *Codex repetitæ prælectionis*. It is now ordinarily called simply the *Code* of Justinian, though Hugo, considering that the other collections of Justinian are also entitled to the name of codes, would term *this* in accordance with the *Turin Gloss*, *Constitutionum Codex*. The code is divided into 12 books, and the books into titles. The general arrangement corresponds on the whole with that of the *Pandects*, so far as the two works treat of the same subject, but there are some variations which cannot be accounted for. For instance, the law of pledges and the law of the father’s power occupy very different relative positions in the *Pandects* and in the *Code*. Under each title, the constitutions are arranged chronologically. They do not go further back than the reign of Hadrian, the matter of older constitutions having been fully developed in the works of jurists.

The No-
vells.

Justinian, though fond of legal unity, was also fond of law-making. If he had lived long enough, there might probably have been a third edition of the *Code*, and perhaps a second edition of the *Pandects*. When the new *Code* was published, he anticipated the formation of a separate collection of *Novells*, but there is no decisive proof that the *Novells* were collectively published by authority in his lifetime, though between 534 and his death in 564 or 565, upwards of 150 new constitutions (*νεαπαὶ διατάξεις*) were separately promulgated, which made many reforms of great consequence, and seriously affected the law as laid down in the *Pandects*, *Institutes*, and *Code*. There is a marked diminution in the number of *Novells* after the death of Tribonian in 545.

Such were Justinian’s legislative works—works of no

mean merit—nay, with all their faults, considering the circumstances of the time, worthy of extraordinary praise. They preserve precious remains (remains precious as materials for thinking, and as models of legal reasoning), which would else have been wholly lost. They have long exercised, and, pervading modern systems, continue to exercise, enormous influence over the thoughts and actions of men. If adherence to their contents cramped, on the one side, the spontaneity of indigenous development, it opposed barriers, on the other, to the progress of feudal barbarism. In spite of a certain enslavement to elements originally base, they exhibit a striving in chains towards the natural, the rational, and the good.

We must now say a few words concerning the editions, separate and collective, of Justinian’s compilations. The editions up to the end of the first third of the 16th century, called *incunabula*, are scarce, for, from the inconvenience of their form, the variety of contractions they employ, and the want of numbers to the fragments or paragraphs, they have been subjected to the same fate as the early manuscripts; but, like the early manuscripts, they are often of use in correcting the text.

The first printed edition of the *Institutes* is that of Petrus Schöffler (Mainz. 1468, fol.). The last edition of importance is that of Schrader (Berlin, 1832). This is intended to form the first part of a projected *Berlin Corpus Juris Civilis*, which is still promised, but has hitherto made no further visible progress.—Among the commentators, Vinnius, Otto, and Costa are in the first rank. There are useful modern French commentaries and translations by Blondeau, Ducaurroy, and Ortolan. We regard the Greek paraphrase of Theophilus as the most useful of all commentaries, but the work is so clear as seldom to require explanation; and not without reason was an Essay, as long ago as the first year of the 18th century, composed by Homberg, professor of law at Helmstadt, *De multitudine nimia Commentatorum in Institutiones Juris*. The most valuable critical editions, anterior to Schrader’s, are those of Haloander (Nuremb. 1529), Contius (Paris, 1567), Cujas (Paris, 1585), or re-edited by Köhler (Göttingen, 1773), Biener (Berlin, 1812), and Bucher (Erlangen, 1826).

The literary history of the *Pandects* has been a subject of hot and still unextinguished controversy. The most celebrated existing manuscript of this work is that called the Florentine, written by Greek scribes, probably not later than the end of the 6th or the beginning of the 7th century. Many have supposed it to be one of the original copies transmitted to Italy in the lifetime of Justinian; but, though it is in general free from contractions and abbreviations, which were strictly forbidden by the emperor, letters and parts of letters are sometimes made to do double duty, as *necesse* for *necesse esset* (*geminationes*) and *AB* for *A B* (*monogrammata*). The Florentine MS. was for a long time at Pisa, and hence the glossators refer to its text as *litera Pisana* (*P.* or *Pi.*) in contradistinction to the common text, *litera vulgata*. Its history before it arrived at Pisa is doubtful. According to the testimony of Odo-fredus, who wrote in the 13th century, it was brought to Pisa from Constantinople; and Bartolus, in the 14th century, relates that it was always at Pisa. We are strongly inclined to put faith in the constant tradition, supported by Brenemann (*Historia Pandectarum*) with

much weight of evidence, that it was given to the Pisans by Lothario the Second after the capture of Amalfi in 1133 (?) as a memorial of his gratitude to them for their aid against Roger the Norman. The truth or falsehood of this tradition would be a matter of little importance if it were not usually added, among other more apocryphal embellishments, that the finding of the MS. and its removal to Pisa attracted the attention of the neighbouring school of Bologna to the study of Roman law. It is certain that, soon after the capture of Amalfi, the Roman law, which had long been comparatively neglected, was brought into remarkable repute by the teaching of Irnerius; but this resurrection is attributed by Savigny to the growing illumination of men's minds and that felt want of legal science which the progress of commerce and civilization naturally produces. He thinks that curiosity, excited by these causes, not by any sudden discovery, had only to put forth its arm and seize the sources of Roman law, which were previously obvious and ready for its grasp.

Pisa was conquered by the Florentine Caponus in 1406, and the MS. was brought to Florence in 1411, ever since which time it has been kept there as a valuable treasure, and regarded with the utmost reverence. Where the Florentine MS. may have been before the siege of Amalfi is of little consequence; but it is of great consequence to decide another much disputed question, namely, whether the Florentine MS. be or be not the sole authentic source whence the text of all other existing MSS., and of all the printed editions, is derived. In favour of the affirmative opinion there are several facts which have not, we think, been very satisfactorily accounted for. The leaves of the Florentine MS. are written on both sides, and the last leaf but one, in binding the volume, has been so placed as to reverse the order of the pages. This fault is copied in all the existing manuscripts. The order of the 8th and 9th titles, in the 37th book, is reversed in the Florentine MS., but the error is corrected by the scribe by a Greek note in the margin. There are fragments similarly reversed in lib. xxxv. tit. 2, and lib. xl. tit. 9, and similarly corrected. In the other existing old MSS., written by men who did not understand Greek, the error is re-produced, but not the correction; whereas omissions in the Florentine text, which are supplied in Latin in the margin, are to be found supplied in the other MSS. The words "*pro soluto*" are thus supplied at the end of the 3rd title of the 41st book, and the words "*non ad mortis tempus referuntur*," in l. 1, *D. Unde Liberi* (xxxviii. 7). In the 20th and 22nd titles of the 48th book, the Florentine MS. omits several fragments, which were first restored by Cujas from the *Basilica*. The omissions exist in all the other manuscripts. In general, where the text of the Florentine MS. presents insuperable difficulties, no assistance is to be derived from the other manuscripts; but they all retain the errors of the Florentine. Moreover, they appear to be all later than the beginning of the 12th century.

In opposition to these facts, the supporters of the conflicting theory, of whom Savigny, being one of the latest and not the least able, is the best known, adduce many passages of the ordinary text in which the omissions and faults of the Florentine MS. are corrected and supplied. Some of the variations are not improvements, some may be ascribed to critical sagacity and happy conjecture, and some may have been drawn

Law.

from the *Basilica* or other Eastern sources; yet, in the list which Savigny has given, a few variations remain which can scarcely be accounted for in any of these ways. Such being the state of the question, we are disposed to adopt the hypothesis, that the early glossators may have been acquainted with one manuscript or more, containing the whole or part of the *Pandects*, and not copied from the Florentine, but copied from the same original—not exempt from faults—from which the Florentine was immediately copied. The Florentine, and the issue descended from the parent of the Florentine, exhibit many of the defects of their common ancestor, with some independent beauties and deformities of their own (*See Thibaut, Inst. und Herm. des R. R. p. 409*).

Four palimpsest leaves of a MS. of the *Pandects*, probably nearly as old as the Florentine, were discovered at Naples by Gaupp, and an account of them was published by him at Breslau in 1823. They belong to the 10th book, but are nearly illegible.

In most of the manuscripts and early editions the *Pandects* consist of three nearly equal volumes. The first, comprehending lib. i.—xxiv. tit. 2, is called *Digestum vetus*; the second, comprehending lib. xxiv. tit. 3. lib. xxxviii., is called *Infortiatum*; the third, comprehending lib. xxxix.—lib. l., is called *Digestum novum*. The *Vetus* and *Novum* are each again divided into two parts. The second part of the *Vetus* begins with the 12th book; that of the *Novum* with the 45th. The *Infortiatum* is divided into three parts; of which the second begins with the 30th book, and the third (*mirabile dictu!*) with the words *tres partes*, occurring in the middle of a sentence in l. 82, *D. ad Leg. Falc.* (xxxv. 2). This third part is hence called *Tres Partes*. The glossators often use the name *Infortiatum* exclusively for the first two parts of the second volume, e. g., *Infortiatum cum Tribus Partibus*, and sometimes the *Tres Partes* are attached to the *Novum*. In order to explain these peculiarities many conjectures have been hazarded. It is most probable that the division owes its origin partly to accident,—that the *Vetus* first came to the knowledge of the earliest glossators; that they were next furnished with the *Novum*; then with the *Tres Partes*, which they added to the *Novum*; and that then they got the *Infortiatum*, so called, perhaps, from its being forced in between the others; and that finally, in order to equalize the size of the volumes, they attached the *Tres Partes* to the *Infortiatum*. The common opinion is that the *Infortiatum* derived its name from having been reinforced by the *Tres Partes*.

The editions of the *Pandects*, with reference to the character of their text, may be divided into three classes—the Florentine, the Vulgate, and the mixed. Of the Florentine editions (so called from their representing the text of the Florentine MS.), the most beautiful, the most celebrated, and the most pure, was that published at Florence in 1533 by Lælius Taurellius, who, out of paternal affection, allowed his son Francis to name himself as the editor. The Vulgate editions have no existing standard text to refer to. The ideal standard is the text formed by the glossators, as revised by Accursius. Their number is immense. The first *Digestum Vetus* appeared at Venice, 1477; *Infortiatum*, Rome, 1475; *Novum*, Rome, 1476. In the early vulgate editions, the Greek passages of the original are given for the most part in an old Latin translation, and the inscriptions prefixed to the extracts, and referring

Law.

to the work and the author, are either imperfect or wanting. Of the mixed editions, the most distinguished is that of Haloander (Nuremberg, 1529), a daring and adventurous critic.

Among the commentators on the *Pandects*, the best known in this country, and among the best, are Noodt, Voet, and Pothier. The *Meditationes in Pandectas* of Leyser, and the *Notæ* of A. Schulting, with observations by Smallenberg, are very voluminous,—the latter exceedingly good. Still more voluminous are the German *Erläuterungen* of Glück, extending, with the continuations of Mühlenbruch and Reichardt, to above 40 parts. They are interesting as shewing the construction put upon the law of the *Pandects* in cases that occur in modern practice. Some of the ablest modern civilians admire the older commentators—Duarenus, Cujas, Faber.

Editions of the Code.

In the early editions of the *Code*, the first nine books are often separated from the latter three, which, relating principally to the public law of the Roman empire, were often inapplicable in practice under a different government. The inscriptions and subscriptions of the constitutions are almost always wanting, and the Greek constitutions are omitted. Haloander (1530) considerably improved the text, but Contius (*Le Conte*) was the first to restore to their proper place the omitted Greek constitutions (*leges restitutæ*). In modern times, Witte and Biener have directed their attention specially to the critical examination of the *Code*. In Goeschen's preface to the first edition of *Gaius* is mentioned the discovery at Vienna of some *folia rescripta* of a very ancient manuscript, which contains some new Greek constitutions. A copy of the decyphered text, made by Blume, has been placed at the disposal of the editors of the unfinished Leipzig edition of the *Corpus Juris Civilis*, first brought out under the auspices of the brothers Kriegel.

Cujas and Wissenbach are among the best commentators on the *Code*.

Editions of the Novells.

Justinian published most of his *Novells* in Greek; some in Latin only (e. g., the *Novells* now numbered 9, 11, 23, 33, 62, 65), from their relating exclusively to the affairs of the West; some in Greek and Latin (e. g., *Novells* 32 and 111, and also *Novells* 17 and 18, though the original Latin of the latter two no longer exists). We possess the *Novells* in three ancient forms: the Latin *Epitome* of Julian, containing 125 *Novells*; an ancient Latin translation, containing 134 *Novells*; and a Greek collection, numbering 168 *Novells*. We shall speak of these in order.

The *Epitome Novellarum* was made by Julian, a professor of law at Constantinople, and a contemporary of Justinian. The last constitution it contains bears date 556, and it is probable that the *Epitome* was made soon after that date, especially as from its language it appears intended for the Italians, who had been reduced under the dominion of Justinian by the conquest of the Ostrogoths in 554. The earliest manuscript is that of Ranconetus, of the 8th century, now in Paris. The earliest printed edition is that of Boerius, in 1537, from a Mantuan manuscript; the best known, that of Pithou (fol. Basil, 1576). Manuscripts of the work have been found by Blume at Vercelli, and by Lancizolli at Vienna. An extract from the latter is given by Biener in the 5th volume of the *Zeitschrift*. The first 39 constitutions have no marked chronological arrangement; constitutions 40 to 117 inclusive, are

arranged chronologically; and the remaining eight constitutions appear to be an appendix without order. The work is often an improvement on the original *Novells*, leaving out the *proæmia* and *epilogi*. The constitutions in the *Epitome* are invariably quoted by the glossators under the name *Novellæ*.

The ancient Latin translation is ascribed by the glossators to the time of Justinian, and, notwithstanding the badness of its Latinity, it is not improbable that it was made, perhaps by different authors in succession, in the lifetime, or soon after the death, of Justinian, for the use of the Italians. It contains none of those marks of Byzantine interpolation which appear in the Greek collection; and, unlike the Greek collection, it contains no constitutions later than the time of Justinian. Schweppe (*R. R. G.* § 126 c.) conjectures that it was a translation from a Greek collection made in Illyricum. Of the 134 *Novells* which it numbers, the first 129 are in chronological order; the last five are an appendix, arranged with some regard to dates. To this translation the glossators gave the name *Authenticum*, to distinguish it from the *Epitome* of Julian, and as a recognition that it contained the legal text—a proposition which had once been doubted by Irnerius. A single *Novell* in the *Authenticum* was called an *authentica*. The Greek collection was wholly unknown to the glossators. After the discovery of the Greek originals, the *Authenticum* was distinguished from subsequent Latin translations by the name *versio vulgata*. Of the 134 *Novells* contained in the *versio vulgata*, the glossators recognized only 97 as practically useful, and these were the only *Novells* to which they appended a gloss. As the *Institutions*, *Pandects*, and *Code* were divided into books and titles, the glossators pedantically divided the 97 glossed *Novells* (which they arranged chronologically) into nine books, intended to correspond with the first nine books of the *Code*. These books were called *collationes*. Under each collation were placed a certain number of constitutions, and each constitution formed a separate title, except the eighth, which was divided into two titles. There were thus 98 titles. The rubrics of the constitutions, and the division into chapters and paragraphs, though not due to Justinian, were probably older than the glossators, and to be attributed to the original collectors or translators. The 97 glossed *Novells*, thus divided, constituted the *liber ordinarius*; the remaining *Novells* of the *Authenticum* (which were called *extravagantes* or *authenticae extraordinariae*) were divided into three *collationes*, to correspond with the last three books of the *Code*; but, as they were not used in forensic practice, they soon ceased to be copied in the manuscripts. Among the later manuscripts, however, there are a few in which, if Puchta's statement be correct, *extravagantes* (sometimes more, sometimes fewer) may be found introduced among the *novem collationes* (1 Puchta, *Inst. und Gesch. R. R.* 708). The oldest manuscript of the *Authenticum* is one of Vienna of the 13th century, containing 133 *Novells* out of the 134. The ancient Latin version of the 62nd and 75th *Novells*, before known only from the *Epitome* of Julian and the Greek *summa*, was first published from this manuscript by Savigny (*Zeitschrift*, ii. 100), and an original Latin constitution of Justinian concerning debtors in Italy and Sicily, before wholly unknown, was published from the same manuscript by Biener (*Zeitschr.* v. 352). The oldest printed edition of the *versio vulgata* is that of Vit.

Law.

Law. Pücher, containing the 97 *Novells*, with the gloss, followed by the three last books of the *Code* (Rome, 1476).

A Greek collection of the *Novells* of Justinian was made for the use of the Oriental lawyers, probably under Tiberius II., who reigned 578-82. It is cited by numbers in the *Basilica*, and it is numbered up to 168, but it does not really contain 168 *Novells*, for the Latin constitutions, which were not of practical use in the East, are not translated, but are given only in Greek *summæ* or abstracts. Some of the *Novells* it contains are numbered twice. This is the case with the *Novells* numbered, in the present editions of the *Corpus Juris*, 32 and 34, 41* and 50, 75 and 104, 143 and 150. This repetition may be accounted for, in the case of the first and last pairs, by the fact that the same *Novell* was published in Greek and Latin, and, in those different forms, sent into different parts of the empire. The Greek collection was not confined to constitutions of Justinian. There are four of Justin II., viz.—*Nov.* 140, 144, 148, 149; three of Tiberius II., viz.—*Nov.* 161, 163, 164; and four edicts (*eparchica, formæ*) of the *præfectus urbi* and *præfectus prætorio*, viz.—165-168. These edicts, possibly, were introduced as having obtained the imperial sanction. That the genuine Greek collection consisted of neither more nor less than 168 numbers, appears from a Greek list of the 168 titles, which was found in the Queen's Library at Paris, and thence called *Index Regineæ*. A Latin translation of this list was published by Cujas in his *Expositio Novellarum* (1570), and the original Greek text is given in the second volume of Heimbach's *Anecdota* (1840), p. 237. The first 120 *Novells* of this collection are in chronological order; the remainder are intermixed.

We have already stated that the Greek *Novells* were wholly unknown to the glossators. Haloander was the first who published a collection of them at Nuremberg, in 1531, from a Florentine manuscript. Scrimger, a Scotchman and professor of civil law at Geneva, afterwards published a much more complete collection of the Greek *Novells* from a Venetian manuscript. The collection of Scrimger was printed by H. Stephanus at Geneva, in 1558. It is stated by Schweppe (*R. R. G.* § 126 b) that the Florentine MS. was of the 15th century, and contained 168 *Novells*; and we are further told by Tigerström (*Aeussere R. R. G.* p. 295, n. 20), who follows Schweppe in these statements, that the edition of Haloander of 1531 contained 165 *Novells*, and that the number was completed in the edition of the Haloandrine *Novells* by Hervagius and others (*in officina Hervagiana*, Basil, 1541). Schweppe also states that the Venetian MS. was of the 13th century, and contained 162 *Novells*, exclusive of an appendix. The appendix contained (a) 13 constitutions of Justinian, improperly called *edicts*; (b) five *Novells* of Justin; (c) a *Novell* of Tiberius; (d) the four edicts of the *præfects*, which appear at the end of the ordinary collection. The 1st, 5th, and 6th (so called) edicts of Justinian are inserted in the body of the ordinary collection as *Novells* 8, 111, and 122 respectively. The 9th edict of Justinian is substantially the same as *Novell* 136. Of the *Novells* of Justin, in Scrimger's appendix,

four appear in the body of the ordinary collection as *Novells* 140, 144, 148, 149.

If the statements of Schweppe as to the number of *Novells* in the Florentine and Venetian MSS. be correct, it would seem that the editions of Haloander and Scrimger cannot be faithful transcripts of them. By reference to Osenbrüggen's edition of the *Novells*, it appears that many of the 168 are wanting in Haloander—a fact which seems to be inconsistent with Tigerström's statement. Again, if, in the body of Scrimger's collection, as in the Venetian MS., there were 162 *Novells*, it would seem that Scrimger must have *Novells* not included in the ordinary collections; for we find from Osenbrüggen that the *Novells* ordinarily numbered 122, 140, 144, 148, 149, 165, 166, 167, 168, being contained in Scrimger's appendix, are not inserted in the body of his collection.

These difficulties, which must occur to an investigating reader, are not explained in the professed histories of Roman law. The fact is, that neither the original edition of Haloander,—nor the subsequent Haloandrine edition of Basil, 1541, which gives at the end a few supplementary *Novells* in Greek, furnished by A. Alciatus and other friends of Hervagius,—nor the Haloandrine edition of Paris, 1542, in which the supplementary *Novells* of Hervagius are introduced in their proper places,—nor, lastly, the edition of Scrimger,—contains anything like the number of *Novells* ordinarily assigned to it. In some cases the mere title of a *Novell*, which was not found in the manuscripts, was inserted; in some cases not even the title of an omitted *Novell* is inserted, but its number is given, and the *lacuna* is marked by asterisks. It might as well be said that the body of Scrimger's collection contains 168 *Novells* as that it contains 162. The last *Novell*, indeed, which it contains at length is numbered (ρξβ) 162, but the remaining six are thus accounted for in a marginal note,—

“Here the old manuscript contains the following memorandum:—*Novell* 163 is not copied here, as being the 5th of Tiberius; in like manner *Novell* 164 is omitted, as being the 2nd of Tiberius; *Novell* 165 could not be found; *Novell* 166 is the 1st *forma* of the *eparchica*; *Novell* 167 is the 24th *forma* of the *eparchica*; *Novell* 168 is the 2nd *forma* of the *eparchica*.”*

There are similar marginal notes in the middle of Scrimger's collection, accounting for omitted *Novells*.

It seems from his preface that Scrimger was acquainted with a manuscript collection of *eparchica*. An *Index* to a collection of 39 *eparchica* has been recently published for the first time by C. E. Zachariæ in his *Juris Græco-Romani Delineatio* (Heidelberg, 1839).

We proceed now to give an account of the modern Latin translations, and of the origin of the modern mixed editions of the *Novells*.

Haloander gave a Latin version not only of such of the Greek *Novells* in his own collection as were not included in the *Authenticum*, but of those which had already appeared in the semi-barbarous and obscure *versio vulgata*. Scrimger's Greek collection was published without a translation; but the *Novells*, which are contained in Scrimger and not in Haloander, were translated by Agylæus (*Supplementum Novellarum*,

* In place of *Novell* 41, the Vulgate editions, following Contius, have inserted Julian's epitome of a constitution referred to in the preface of *Novell* 41.

* Ενταῦθα τὸ παλαιὸν ἀντίγραφον γεγραμμένον ἔχει ταύτην τὴν ὑπόμνησιν. Ἡ ρξγ οὐκ ἐγράφη ὡς, ὡς οὐσα εἰ Τιβερίου, ἀσάφως δὲ ρξδ, ὡς οὐσα β Τιβερίου, ἢ δὲ ρξε οὐκ εὐρίσθη, ἢ δὲ ρξς ἐστὶ τύπος α τῶν ἐπάρχων (sic), ἢ δὲ ρξξ ἐστὶ τύπος α τῶν ἐπάρχων, ἢ δὲ ρξη ἐστὶ τύπος β τῶν ἐπάρχων.

Law. Coloniae, 1560), who is often erroneously spoken of as if he had made a complete translation of the whole.

Such were the principal events in the literary history of the *Novells* before the editions of Contius, whose labours have been the foundation of all subsequent editions. For the basis of his Greek text, Contius took, as the best and fullest, the edition of Scrimger, and resorted to Haloander where Haloander's collection contained matter not in Scrimger. In this manner he made up, between both, 164 Greek (so called) *Novells*; but of these some are mere abstracts,—some nothing but titles of *Novells*. For his Latin text, he took as the basis the *versio vulgata*, so far as he was acquainted with it. He made use of 12 of the *authenticæ extravagantes* in addition to the ordinary 97. For the Greek text supplied by the collections of Haloander and Scrimger, so far as it was not translated in the *versio vulgata*, he formed a translation, partly his own and partly compiled from Haloander. To this he subjoined the matter contained in Julian's *Epitome*, so far as it was not contained in the *Authenticum* or the Greek *Novells*. In this manner he made up the 168 Latin *Novells*, which compose the stock of *Novells* in ordinary editions of the *Corpus Juris Civilis*.

Such is the account given by Thibaut, an accurate and careful writer, who attributes to Contius a pre-determination to make up the number 168, and charges him with using a little trickery (*"schelmerei"*) in order to effect this object; as if to Contius belonged the idea of counting the doubled *Novells* twice,—of inserting constitutions of Justin and Tiberius, and edicts of præfects (Thib. *Herm. und Kritik des R. R.* 427). This mode of counting seems to be more properly chargeable upon the persons who originally formed the Greek collection.

Contius published many editions of the *Novells*, differing among themselves in a way which it is of importance to remark. They appeared in the years 1559, 1562, 1565, 1566, 1571, 1576, 1579, 1581. The early editions contained only the Latin text of 168 *Novells*; the later contained also the 164 Greek *Novells*. Some of the editions contained the gloss, and in these the 97 glossed *Novells* were arranged, as usual, in the old nine *collationes*, while all the remaining *Novells* were subjoined as a tenth *collatio*. A momentous and memorable change, however, took place in the unglossed edition of 1571. In this, Contius classed the 168 *Novells* with reference to their dates, though there are some exceptions to the chronological order. Thus *Nov.* 113 is later than *Nov.* 125. Moreover, for ancient custom's sake, he distributed the 168 *Novells*, so arranged, into nine *collationes*, and subdivided the *collationes* into titles. After this came the appendix of Scrimger, and some supplementary *Novells* of Justinian, Justin II., and Tiberius II., known from the *Epitome* of Julian. The same order was reproduced in the edition of 1581, and has been followed ever since in all but the glossed editions.

We have taken considerable pains to present the reader with the result of all the authorities within our reach on an exceedingly perplexing subject. With respect to the literary history of the *Novells*, the information to be met with in ordinary books is unsatisfactory, and often erroneous. From the account which we have given, it will easily be imagined that great confusion has been occasioned in references by the varieties of arrangement in different editions of the *Novells*. For example, the 131st *Novell*, which, accord-

ing to the arrangement of Contius, forms the 14th title of the 9th *collatio*, was the sixth title of the 9th *collatio* of the old glossators. It may be useful to state, that the 97 glossed *Novells* are the following:—*Novv.* 1–10, 12, 14–20, 22, 23, 33, 34, 39, 44, 46–49, 51–58, 60, 61, 63, 66, 67, 69–74, 76–86, 88–100, 105–120, 123–125, 127, 128, 131, 132, 134, 143, 159. The following were the *extravagantes*, which, though known to the glossators, were not glossed; *Novv.* 11, 13, 21, 24–29, 30, 31, 35–38, 40, 42, 43, 45, 50, 59, 62, 64, 65, 68, 87, 101–103, 129, 130, 133, 144–147. Of the remaining *Novells* the glossators were ignorant. For the purpose of thoroughly understanding the references to the *Novells* made by the glossators and more recent civilians, it would be desirable to have several parallel lists. These should be, for instance, (1), a list showing how the glossed *Novells* were arranged in the original *collationes*, and designating by numbers the different places they occupy in the old and the new *collationes*; (2), a list of the *Novells* not known to the glossators, showing the places of their insertion in the modern *collationes*; (3), a list of the *Novells* of the *Epitome* of Julian, showing the correspondence of their numbers with the numbers of the modern *Novells*.

Much labour and learning have been recently expended in unravelling the intricacies of this part of literary history, and in correcting the errors of former writers on the *Novells*. Biener's *Geschichte der Novellen Justinians* (Berlin, 1824) is a work of very high reputation, containing the most elaborate and accurate information on the subject.

Of modern editions since the time of Contius, it is unnecessary to say much. Under the title *Novellæ Constitutiones Justiniani, a Græco in Latinum versæ operâ Hombergk zu Vach* (Marburg, 1717, 4to), more is performed than is promised. The author presents to us not only a very good new Latin translation, but the Greek text, and a series of Latin *Novells* from the *Authenticum*, of which the original Greek has not been preserved, and good critical notes. The translation of Hombergk zu Vach is the basis of that of Osenbrüggen, the latest editor. A more correct transcript of the 87th *Novell* than had previously appeared was given by C. J. A. Kriegel (Lips. 1832). G. E. Heimbach, in the first volume of his *Anecdota* (Lips. 1838), has announced his intention of publishing a new edition of the *Novells*, and it is to be hoped that he will fulfil his intention, for he comes prepared for the work with unusually important aids, derived from the collation of manuscripts and the abridgments of ancient scholiasts. The oriental ecclesiastical writers of the Græco-Roman Empire have preserved some fragments of *Novells* of Justinian connected with the church. Ten such fragments exist in a collection of *Johannes Antiochenus Scholasticus*, published in the second volume of G. E. Heimbach's *Anecdota*, 1840, and there is an account of another such collection in Richter's *Krit. Jahrb.*, 1838.

We have stated that the *Novells* were designated by the name *Authenticæ*, but that word has also another signification which it is necessary to explain in order to prevent the mistakes which have sometimes occurred in consequence of this verbal ambiguity. In their lectures on the *Institutes* and the first nine books of the *Code* (which are the books most practically useful), the earliest glossators were accustomed to insert in the margin of their copies abbreviated extracts from such

Law.

Law. parts of the *Novells* as made alterations in the law contained in the text. In reading the *Pandects*, they referred to the notes contained in the margin of the *Code*.—At a later period, these abstracts were discontinued in the *Institutes*.—In the *Code*, they were taken from the margin and placed under the text, where they still appear, distinguished by italic type in most of the modern editions. They are called *Authenticæ*, not, as some assert, from their representing the latest authentic state of the law, but from the name of the source whence they were taken, and which in practice they nearly superseded. Certain capitularies of Frederic I. and II., emperors of Germany, about the end of the 12th century, were treated by the glossators as *Novells*, and thirteen extracts taken from them are inserted in the *Code* with the inscription *Nova Constitutio Frederici*. They are known by the name *Authenticæ Fredericianæ*.

Corpus
Juris Civilis. The collections of Justinian, together with some later appendages, formed into one great work, are commonly known by the name *Corpus Juris Civilis*.

Later ap-
pendages
to the col-
lections of
Justinian. The later appendages are really arbitrary and misplaced additions, having no proper connexion with the Justinianean law, and they vary in different editions.

We have already spoken of Scrimger's edition of the *Novells*, which contained, in a kind of appendix, some constitutions of Justin II. and Tiberius II. The same volume contained also a collection of constitutions of the Eastern Emperor Leo the Philosopher, anterior to 893. These were appended by Contius to the Justinianean *Novells* in his edition of 1571, and his example has been followed by subsequent editors.

Some constitutions of Byzantine Emperors, from the 7th to the 14th century, were published for the first time, with a Latin translation, by Bonifidius (*de Bonnefoi*), in 1573, in his *Jus Orientale*, were admitted by Charondas into the *Corpus Juris* in 1575, and have been since generally retained.

Haloander added to his edition of the *Novells* the *Canones sanctorum Apostolorum*, since they were recognized in the sixth *Novell* as a source of existing ecclesiastical law. They are added to most editions of the *Corpus Juris Civilis*.

The *Feudorum Consuetudines*,—a Lombard compilation of feudal law, formed about the middle of the 12th century from the notes and treatises of several authors, especially the letters of Obertus de Orto,—followed by a few constitutions of German and French monarchs, and the *Liber de Pace Constantiæ* (1181), are, in many editions, the last appendages to the *Corpus Juris Civilis*. The *Libri* or *Consuetudines feudorum* are believed to have been appended to the *Novells* as a tenth *collatio* by Hugolinus de Presbyteris about the beginning of the 13th century.

The expression *Corpus Juris* was employed by Justinian himself (l. 1, *pr. C. de Rei Uxorice act.* (v. 13)); but the earliest editions of the whole of his collections have no single title. Russardus first chose the title *Jus Civile*. The modern name, *Corpus Juris Civilis*, appears first in D. Godefroi's edition of 1583 (*qu.* 1604), though the phrase had been employed by others before him. The old glossed editions consist of five volumes, folio, usually bound in five different colours, *viz.*,—I. *Digestum Vetus*; II. *Infortiatum*; III. *Digestum Novum*; IV. The first nine books of the *Code*; V. *Volumen*. The *Volumen* contained, first the 97 glossed *Novells*; then the last three books

of the *Code*, called the *tres libri*; then the *Libri Feudorum*; then a collection of constitutions of German and French monarchs; and, last of all, the *Institutes*. The *Institutes* are often spoken of as distinct from the *Volumen*, and the name *Volumen* is then confined to the preceding contents of the 5th volume. Originally there was no common title-page to the five volumes. The editions of the *Corpus Juris* may be divided into those which have the gloss, and those which have it not. The gloss is an annotation gradually formed in the school of Bologna, and finally settled by Accursius. It is of great practical importance, since, in the countries which adopted the Civil Law, the portions without the gloss did not possess legal authority in the courts. *Quod non recipit glossa, id non recipit curia*, was the general maxim. All the editions up to 1518 have the gloss. The latest edition with the gloss is that of J. Fehius, (Lyons, 1627). This celebrated edition has on the title-page of every volume (in allusion to the place, Lyons), the representation of a living lion surrounded by bees, with the motto *Ex forti dulcedo*. Hence it is known by the name *Edition du lion moucheté*. The very valuable index of Daoyz ought to be appended to it as a 6th volume. Of the editions without the gloss, some have notes and some have none. Of the unglossed editions with notes, the two most celebrated and useful are that of D. Godefroi and Van Leeuwen (Amsterdam, 1663, 2 tom. fol.), and that of Gebauer and Spangenberg (Göttingen, 2 tom. 4to.) Of the editions without notes, the most beautiful and convenient is the well-known Elzevir of 1664, distinguished as the "*Pars Secundus*" edition, from an error in p. 150. Two editions by Beck, one in 4to, one in 8vo, have lately been completed. That commenced by the brothers Kriegel, in 1833, and continued by Osenbrüggen and Hermann, is not yet finished. The edition undertaken by Schrader and other eminent scholars, will, if completed as it has been begun, supersede for some purposes all that have gone before it. The old editions of Contius, Russardus, Charondas, and Pacius are sought for by critics.

In the *Institutes* the titles are divided into paragraphs; in the *Pandects*, into *leges*, otherwise called *fragmenta* (separate extracts); in the *code*, into *leges*, otherwise called *constitutiones*; in the *Authenticæ* or *Novells*, into *capita*. Again, in the *Pandects*, *Code*, and *Authenticæ*, the *leges* or *capita* are in some cases subdivided into paragraphs or sections; but in the time of the glossators these divisions and subdivisions were not numbered, and hence initial words were usually used in citation.* The letter *D.* denotes the *Digest*; and it has been proved that from this letter, not from the

Law.

Mode of
citing the
collections
of Justi-
nian.

* Some have thought that the use of initial words in citing was introduced on account of the uncertainty occasioned by the variation of the numbering in different editions. The ancient mode of citation, before the time of Irnerius, was by numbers. This appears from Theophilus, the *Basilica*, and other Greek sources, from the *Turin gloss*, from Ivo of Chartres, &c. In the fragments of the MS. of the *Pandects* discovered by Gaupp, the *leges* are numbered. Even now, the editions in common use are not uniform in their numbering. For example: in some editions of the *Institutes*, the 6th title of the 3rd book is improperly divided into two titles. A 7th title, *de Servili Cognatione*, is made to begin with *tit. 6, § 10*, thus increasing by a unit the number of every subsequent title in the 3rd book. The mode of citing by numbers has been objected to on account of its easiness and simplicity, which would tend to diminish the industry of students, and derogate from the maxim that a civilian ought to have *ferreum caput, plumbeas nates, auream crumenam*.

Law.

Greek π , came the symbol *ff*, which also denotes the *Digest*. *ff* is, in fact, the corrupted form of an old *D.*, which, in writing, is left open at top, and has a stroke across it to denote abbreviation. *J.* denotes the *Institutes*; *C.* the *Code*; *Auth.* or *Nov.* the *Novells*. The following examples will illustrate some of the various modes of citation.

§ *Fratriis vero*. *J. de Nuptiis* refers to the section beginning with the words *fratriis vero*, of that title in the *Institutes* which has the rubric *de Nuptiis*. Upon referring to the letter *N* in an alphabetical list of titles, we find it to be the 10th of the first book. The old civilians from practice knew well the order of the titles without consulting any index. On looking through the sections of the 10th title of the first book of the *Institutes*, we find that the third section is the passage we are seeking for, since it begins with the words *fratriis vero*. It is unusual now to give the initial words of the paragraph, though the rubrics of the titles are still commonly given. The present ordinary mode of citing the passage above referred to would be § 3. *I. de Nuptiis* (i. 10); or, in the more simple mode approved by Gibbon, *I. i. 10, 3*, beginning at the larger and ending at the smaller division.

The sixth section of the fifth law of the third title of the twenty-third book of the *Pandects* would now be ordinarily referred to thus,—*L. 5. § 6, D. de Jure Dotium* (xxiii. 3); or thus,—*D. 23, 3, 5, 6*; or thus,—*L. 5, § 6, D. de Jure Dotium*. The latter is the usual mode of referring to titles frequently quoted, and therefore so well known as not to require indication by number. Such, for example, are the titles *de R. I.* (i. e. *de Regulis Juris*), and *de V. S.* (i. e. *de Verborum Significatione*). Various modes of citation were employed at different periods. *D. 23, 3, 5, 6*, would, by the ancient glossators, have been cited thus,—*D. de Jure Dotium, L. Profectitia, § Si pater*; or, later, thus,—*L. Profectitia, § Si pater, D. de Jure Dotium*; or, still later, *L. Profectitia 5, § Si pater 6, D. de Jure Dotium*. This last-mentioned mode is objectionable from its ambiguity; for when more than one *lex* in the same title begins with the same word, a similar notation is used; thus,—*L. Procurator 3 D. de Procur.* denotes the 3rd of the four *leges*, which, in the title *de Procuratoribus*, commence with the same word *Procurator*. *fr.* is sometimes used instead of *L.*, and *ff.* instead of *D.* The initial section of an extract or *lex* divided into sections is not numbered, and is referred to by the letters *pr.* For instance, *fr. 5, pr. ff. de Jure Dotium* (xxiii. 3). That which is really the second section is called the first, and numbered § 1. It is to be observed that the 30th, 31st, and 32nd books of the *Pandects* all treat *de Legatis et Fideicommissis*, and are not divided into titles. They are designated respectively as *D. de Legatis I.*, *D. de Legatis II.*, and *D. de Legatis III.* Thus, *L. 108, § 3, D. de Legatis I.* might be otherwise represented *D. 30, 108, 3*.

The *Code* is cited like the *Digest*,—now ordinarily thus,—*L. 22, C. Mandati vel contra* (x. 35). *Const.* is sometimes used instead of *L.* To prevent a multiplication of marks, the brackets enclosing the numbers of the book and title may be omitted. This remark is not confined to the *Code*.

The Prefaces to the *Pandects* and to the *Code* are still cited by initial words,—thus, *Const. Tanta*.

The ancient and modern modes of citing the *Novells* differ completely from each other. In the old mode,

the arbitrary division of the glossators into collations and titles was referred to, and the rubric of the title and the initial words of the chapter were employed. When a chapter is subdivided into paragraphs, the initial words of the paragraph alone are occasionally given; for memory, or an index able to guide at once to the smaller division, would render unnecessary the more vague indication. This remark is not confined to the *Novells*. The modern mode of citation is by the number of the *Novell* and chapter. Thus we now cite by the symbols, *Nov. 118, c. 1*, the same passage which would at one time have been referred to thus,—*Auth. de Hered. ab Intestat. § Si quis. col. 9, tit. 1*. Here we may recall attention to the confusion which has been produced by the introduction of newly discovered *Novells*, and their different arrangement at different times. A knowledge of the literary history of the *Novells* is necessary to those who would make successful use of the references which are occasionally to be met with.

The *Authenticæ of the Code*, of which we have given an account, are cited by reference to the title of the *Code* in which they are interpolated; e. g., *Auth. si qua mulier. C. ad S. C. Velleianum*.

It is necessary that we should preface our explanation of the mode of citing the *Consuetudines Feudorum* with an account of the extraordinary manner in which that work is commonly divided in modern editions of the *Corpus Juris Civilis*. We cannot enter into further details of its obscure and perplexing literary history, but desire to warn the reader that the statements usually made with respect to it are partly deficient in important points and partly erroneous. In its authentic and legal shape—the shape in which it is recognized in the courts of those countries where it is received as law—it consists of two books, the first containing 28, and the second 58 titles. In its most ancient shape, indeed, it formed a single book. In editions of the *Corpus Juris Civilis* since that of Pacius in 1580, supplements to the two books have been introduced which have received the name *capitula extraordinaria*, to distinguish them from the *capitula ordinaria* of the two authentic books. Cujas formed a new collection of feudal law in five books. The first three books of Cujas, and the first 72 titles of his fourth book, comprised the same matter as the two ordinary books, but the subdivision into titles by Cujas was different from that which was previously received, and more minute. The remainder of his fourth book was composed of some *capitula extraordinaria* derived from compilations formerly made by Jac. de Ardizzone and Jac. Alvarotus. The fifth book consisted of new materials added by Cujas himself; viz. some constitutions of Germanic emperors, two abstracts of *Novells* of Greek emperors, and the Golden Bull of Charles IV. In most of the modern editions of the *Corpus Juris Civilis* the whole work of Cujas is inserted with the exception of the Golden Bull, but from the mixture of the old and new divisions a strange confusion has resulted. The modern editors have reproduced the authentic text according to the ancient division into two books, whereas, for the unauthentic additions, they have followed the division of Cujas. After the first two books, we read *Liber tertius vacat*. Then follows the heading *Libri Quarti Fragmenta*, and the titles of the fourth book commence with the number 73. No indication is given that the third book and the greater part of the fourth, far from being lost, have been

Law.

Law.

already presented to the reader, inasmuch as the third book of Cujas consisted of what is now given as book 2, titles 23 and 24, and the first 72 titles of the fourth book of Cujas consisted of what is now given as book 2, titles 25-58.

The books of the *Consuetudines Feudorum* were divided from the first into numbered titles and sections, and therefore the work has been usually cited by numbers, not by initial words; thus,—I. F. 14, § 1. This denotes the first *Liber Feudorum*, 14th title, 1st paragraph after the *principium*. For the literary history of the *Libri Feudorum* consult Paetz, *De verâ Librorum Juris Longobardici origine* (Goett. 1805); Dieck, *Literär-geschichte des Longobardischen Lehnrechts*, (Halle, 1828); Laspeyres, *Ueber der Entstehung und älteste Bearbeitung der Libri Feudorum* (Berlin, 1830).

Those who desire to ascertain the particular dates and persons by whom changes in modes of citation were introduced, must refer to the authorities we shall presently name. We must warn the reader that we have not studied accuracy in stating the distinctions (critically and chronologically not unimportant) between capitals and small print, and Roman and Italic type. It may be useful to add that the first part of the *Pandects*, according to the division of Justinian, is called *Prota*; the 4th part, the *Umbilicus Pandectarum*; the 47th and 48th books, which treat of penal law, are called *libri terribiles*. Practice in reading the older writers will soon make a student familiar with the meaning of such contractions as *s.* (supra); *i.* (infra); *l. un.* (lex unica); *t. l.* (totus titulus); *h.* (hic); *e.* (eodem); *arg.* (arguendo); *v.* (videtur); *d. l.* (dicta lex).

For further particulars respecting modes of citation and their history, the following authorities may be consulted. Thibaut's *Civilistische Abhandlungen*, No. 10. Hugo, *Mag. t. iv.* p. 212; B. St. Prix, *Histoire du Droit Romain*, p. 218. Above all, Schilling, *Inst. und Gesch. des Röm. Privat-Rechts*, Einleitung, §§ 38-42.

Ignorance of the modes of citation has sometimes produced absurd mistakes. The citations of the imperial laws by our Bracton are cruelly mangled in the printed editions. Of this, Selden, in the third chapter of his *Dissertation on Fleta*, has advanced one or two examples. The author of *Fleta* was too prudent thus to refer to the sources. He introduces passages of Roman law without saying whence they come.

No subject connected with Roman law occupies at this day more earnest attention, or seems likely to be productive of more precious fruit, than the investigation of its history in the Eastern Empire, and the study of the numerous works which prove the zeal and industry of the oriental jurists. Many of these works have been long published; some have recently been printed for the first time, and several still remain extant in manuscript. An imperfect collection of oriental sources may be found in the *Jus Græco-Romanum* of Leunclavius and Freherus, and a short but masterly sketch of the history of Græco-Roman law by C. E. Zachariæ appeared in 1839.* We must content ourselves with briefly mentioning some of its most important remains.

* From the preface of this work (p. v.) we extract the following passage for the consideration of British statesmen.—“*Præterea si de lege ferenda quærat, neminem vestrum fugit, quam sit necessarium, aliorum populorum mores nosse atque instituta, ut intelligatur, numqua ejusmodi lex apud eos obtinuerit, et utrum comprobata fuerit usu, nec ne. Sic et imperatorum Byzantinorum leges examinasse juvat. Exempli gratia, juxjurandi usus restringendus ne sit nec ne, nuper magnopere disceptatum est. Jam vero extat lex*

Though Justinian disapproved of commentaries, he made the *Corpus Juris* a text-book for law students, who were required to expend five years in wading through its contents. The professors gave lectures and composed extensive paraphrases, which, even in Justinian's life-time, obtained considerable circulation. The laws, however, that had originated in Rome were found in many points not to be well suited to the meridian of Constantinople. While the lawyers were busy in making epitomes and explanations of a system of law which, being for the most part written in Latin, was not understood by the mass of the people, the Byzantine emperors sent forth an abundance of reforming constitutions. At length the necessity of a Roman-Greek code began to be felt, and, after a long term of parturition, the *Basilica* was brought into the world. This collection in turn gave birth to a multitude of *scholia* and commentaries. Nor was the legislative energy of the Byzantine Cæsars less manifest than the industry of the Byzantine lawyers. New constitutions kept coming into the world until the conquest of Constantinople by the Turks in 1453. We proceed to retrace some of the particulars of these events.

The paraphrase of Theophilus upon the *Institutes* (a treatise in which he himself had a share) is an excellent specimen of clear exposition. The best edition is that of Reitz (Hag. Com. 1751, 2 vols. 4to). The German translation by Wüsteman is remarkable for its accuracy and the goodness of its notes. A few extracts from Stephanus and Thalelæus, who belong to the same period, and commented respectively on the *Digest* and the *Code*, have been preserved in the *Basilica* and the *scholia* upon it. The compendiums of the *Novells* by Athanasius and Theodorus are still extant. The latter, with the exception of some fragments, is still in manuscript, but the former was published for the first time by G. E. Heimbach in his *Anecdota*, in 1838. The work *De Temporum Intervallis*, usually attributed to Eustathius, has been often reprinted. The best critical edition of it is that of C. E. Zachariæ (Heidelberg, 1836). The authors above mentioned precede the *Basilica*.

Concerning the successive constitutions of the Byzantine emperors of this period, some valuable notices by Witte and Biener appear in the 8th volume of Savigny's *Zeitschrift*.

Leo, the Isaurian (who reigned A.D. 717-41), perceiving the want of a compact code, compiled an *ἐκλόγη τῶν νόμων*, in 18 titles, about the year 740. The work is extant in manuscript, but its importance is diminished by the consideration that, on account of the arbitrary alterations it introduced, it never enjoyed complete validity, and one part of it after another was set aside by succeeding emperors. A *Manual*, which had more enduring influence, than the *Eclogæ* of Leo, was the *Πρόχειρος νόμος*, in 40 titles, published by the emperor Basilus Macedo about the year 878. It is extracted from the collections of Justinian, the *Eclogæ* of Leo, and *Constitutions* of Basilus himself. It had been long known to exist in manuscript, and it was lately edited for the first time by

imperatricis Irenæ, quæ ab omni juramento abstinendum esse præcipit. Ex cujus historia quam quæstio illa egregie illustrari possit, cur non idem, qui, quæ in Parlamento Anglico de eadem re nuper dicta atque acta sunt, studiose legamus et examinemus, ad Irenæ constitutionem animum advertimus? See also Leunclavius, *Jus Græco-Romanum*, vol. ii. pp. 135-138.

Law.

Law.

C. E. Zachariæ, (Heid. 1837), with very learned literary and historical prolegomena. A revision of this *Manual* was published before the death of the emperor, with the name *ἐπαναγωγή τοῦ νόμου*, and has come to us in an imperfect state. In addition to these compendiums, Basilus formed the plan of reducing into a systematic form all the existing law; and a work entitled *Reformation* (*ἀνακαθάρσις*) of the *Ancient Laws* is mentioned in both his *Manuals*, but it has not survived, and it is probable that it was never published nor introduced into the courts.

The Basilica.

The credit of completing the task and promulgating the projected code was reserved for his son Leo, the Philosopher (who reigned 886–911). This imperial code, commonly known by the name *τα βασιλικά*, consists of 60 books, divided into titles, chapters, and paragraphs. The name was probably chosen from its capacity for a double meaning—expressing not only the royal law-book, but alluding to the name of the preceding emperor.* It was intended to present a complete consolidation of the law, in which the *Institutes*, *Pandects*, *Code*, and *Novells* were to be blended together, and seasoned by the admixture of Byzantine constitutions and legal text-books. This most comprehensive and important work has reached us in an imperfect state. The edition of Fabrotus, in 7 volumes (Paris, 1647), is now not easy to be purchased. Of the 60 books which it contains, there are 27 which are not entirely genuine, but have been fabricated wholly, or in part, out of subsequent commentaries and citations. The Latin translation of Fabrotus was made in great haste and is very imperfect. Four genuine books were subsequently discovered, and may be found in Meermann's *Thesaurus*. A new and much improved edition, commenced by C. W. E. Heimbach in 1833, is now verging towards completion. The *Basilica* and the *scholia* upon it are of the greatest advantage in the criticism of the text of Justinian's collections. They have served to fill up gaps, correct corrupt readings, and elucidate the sense of difficult passages.

Græco-Roman law after the date of the Basilica.

Soon after the publication of the *Basilica* appeared the first *Synopsis Basilicorum*, published originally in alphabetical order. Leunclavius, who edited the *Synopsis* (Basil, 1575), thought fit to arrange the text in the order of the *Basilica*. Synopses of the *Basilica* abound. As a literary curiosity may be mentioned the *Synopsis* of Michael Psellus, composed for the Emperor Michael Ducas in 1070, and written in verses (*πολιτικοὶ στίχοι*), in which accent is supposed to supply the place of quantity. A sample of them may be seen in Irving's *Introduction*, &c., p. 74. "The work," says Thibaut, "betrays an extent of ignorance scarcely excusable even in a poet."

We pass over a crowd of Greek lawyers to come to Harmenopulus,—a jurist who had probably some acquaintance with the productions of the Italian schools. His *Πρόχειρον νόμων* (also called *Hexabiblus* and *Promptuarium*) is a short system of Græco-Roman law, composed about the year 1345, after the order of the *Pandects* of Justinian. The best edition is that of Reitz, in the 8th (supplementary) volume of Meermann's *Thesaurus*. This work long continued to possess authority in the East.

* The name of the collection, *Basilica*, cannot be analogically derived from the name of the Emperor Basilus. The opinions of Zachariæ (which we adopt), as to the authorship and publication of the *Eclogæ* and the *Basilica*, differ from those which had been previously the most generally received.

Until the time of the destruction of the Greek empire by the Turks, the Roman law appears to have been actively cultivated in the East. After that great event, the Greeks were still permitted to retain their own judges and their own laws; and up to modern times, the *Basilica* and the *Promptuarium* of Harmenopulus retained high authority in Greece. In 1830, the President, Capo d'Istria, appointed a commission to revise the *Basilica* and the constitutions of the Byzantine emperors, from which it was his intention to compile a code for Greece. Since the commencement of the new Greek monarchy many legal reforms have been made, founded chiefly on the basis of the modern French codes. The first article of the proclamation of Otho, dated Feb. 23, 1835 (O. S.), declares,—"The civil laws of the Byzantine emperors, contained in the *Manual* of Harmenopulus, shall preserve their force until the promulgation of the Civil Code which we have directed to be compiled." (See Fælix, *Revue de Législation*, tom. vii. p. 288).

If now we turn our eyes to view the fate of the Imperial Law in the Western Empire after the death of Justinian, how great is the contrast! What remaining legal works can we produce as specimens of its vitality, before the time when the school of Bologna started into sudden energy? In the domain of legal literature we travel over a waste, in which the research of Savigny* can scarcely cull a flower.—

"O the dreary, dreary moorland! O the barren, barren shore."

We have the *Turin gloss* on the *Institutes*, possibly contemporary with Justinian, or composed soon after his death during the Greek dominion that succeeded the kingdom of the Ostrogoths in Italy (3 Sav. *Röm. R.* p. 665). Between this and *Petri Exceptiones Legum Romanorum*—a compilation which seems to have been made in Valence—there is no separate legal treatise worth mentioning, and Petrus was certainly not very long antecedent to Irnerius. The Lombard *Brachylogus* was probably later than *Petri Exceptiones*, and the treatise entitled *Ulpianus de Edendo* (which seems to have been a favourite in England) was, in our opinion, not earlier than the first glossators. That the Justinianean law throughout the whole interval maintained a certain traditional existence in practice,—that it survived in part in the organization of the municipal towns in the kingdom of the Lombards,—that, textually, it was not wholly unknown to certain ecclesiastics and canonists, e. g., St. Lanfranc, archbishop of Canterbury,—that traces of it may be found in the collections of *formule*, such as those of Marculfus: these are all established facts. That, in academical instruction, especially in the schools of Ravenna and Rome, it formed, like the study of other branches of ancient literature, a part of general education, we regard as probable. On the other hand, we think it clear that, even in Italy and the kingdom of the Franks, it soon began to fall into disuse without being expressly abolished; and that, in other parts of the West, if we except the occasional and singular learning of some travelled scholar or friend of foreign scholars, whatever was known of Roman law was known not from the collections of Justinian but from other sources.

* Of the long list of quotations from the Justinianean collections which is appended to the second volume of Savigny's history, it is to be observed that the works containing the quotations from the *Corpus Juris* are not, for the most part, treatises upon Roman law.

Græco-Roman law after the destruction of Constantinople, 1453.

Fate of the Justinianean law in the Western Empire.

L A W.

CHAPTER IV.

C A N O N L A W.

Law. 269. HAVING, in the Miscellaneous and Lexicographical Division of this *Encyclopædia*, mentioned, under the title *Canon Law*, some of the most important particulars connected with the subject, we shall confine ourselves at present to the statement of a few facts which it was not necessary to insert in that article, and to an explanation of the ordinary mode of citing the *Corpus Juris Canonici*.

Uses of the canon law. The general canon law, so far as its principles are concerned, appeals much more to the religious and moral feelings than do most of the original doctrines of the Roman civil law; but it wants that purity of style and scientific method which constitute the great value of the juridical works of ancient Rome. The study of it is not calculated to form those habits of severe logic and precise expression which are characteristic excellences in legal authorship; but yet it has much attraction, and holds out much reward to attentive study. Mixed with bigotry and superstition, it will be found to contain many pure elements which deserve to be retained in every system of ecclesiastical law. It is not without its practical uses to the English lawyer, since there are parts of it which have been adopted by usage in our ecclesiastical courts. But it is in an historical aspect that it especially claims regard. It elucidates many important controversies, and unfolds interesting views of the human mind. No one can study the great problems of the constitution of the early Church—of the mutual rights and liabilities of the various ecclesiastical orders, from the highest to the lowest, and of the relations which subsist between the temporal and spiritual power—without deriving aid from the considerations presented by the rules and doctrines of the ancient canon law.

Origin of canon law. Canon law is not synonymous with ecclesiastical law. The latter term relates to the *matter*, the former to the *source*. The latter depends on a scientific division of law; the former refers to a certain historical origin. The English Parliament may make laws concerning bishops and advowsons, but those laws form no part of canon law. On the other hand, the ancient canon law contains many rules not touching upon ecclesiastical matters, and more suited to temporal than to spiritual cognizance. We shall therefore briefly examine the origin of canon law.

After the death of Christ, the early Christians were formed into separate bodies, which still communicated with each other in various ways, and retained a certain unity. As each separate body was a church (*Acts* xiii. 1), so the aggregate association, considered as subject to one Lord, constituted the Church of Christ (*Eph.* i. 22, 23; *v.* 23; *Coloss.* i. 18). It was natural that an association which, like the Christian Church in its

infancy, was not placed under the protection of the civil power, should avoid to bring before the magistrates appointed by the state complaints arising from the infraction of ecclesiastical discipline, or disputes upon points of doctrine and internal order. Hence, in such cases, care was taken that the infliction of punishments and the decision of disputes should be arranged within the bosom of the Church itself. The same tribunals which adjusted these matters took cognizance of temporal causes in which all the parties were Christians. The advice which the Apostle Paul gave to the Corinthians was generally followed (*1 Cor.* vi. 4—6). By means of private arbitration, the Church avoided the unseemly spectacle of submitting ecclesiastical controversies to courts of unbelievers, as well as the scandal which would have resulted from an exposure of the differences of the faithful.

A system of ecclesiastical polity was early developed in the Church. In each limited community, the appointed teachers of Christianity, by virtue of their high and sacred functions, as well as by the natural influence of superior information and intelligence, claimed and obtained a greater degree of consideration, in reference to the settlement of internal disputes, than their fellow-believers. It was by the intervention of those teachers that the mutual intercourse of the several communities was conducted, and power was thus increased by union.

A hierarchical subordination soon grew up among the separate communities which were thus connected. A pre-eminence of honour and respect was voluntarily conceded by the later and the less numerous societies to those which were more considerable and more ancient, and the rank of the bishop rose simultaneously with that of the community of which he was the spiritual head. The bishop, whose seat was a capital city, of large size and great political influence, or whose church could claim the honour of immediate apostolical foundation, was naturally listened to with more than ordinary attention. These distinctions of rank, having thus spontaneously originated among dignitaries of the same order, gradually led to claims of compulsory authority.

There were sometimes assemblies of the bishops of a single province, and sometimes more general assemblies of all the bishops of the Christian Church. The metropolitan or patriarchal bishop, by whom such general councils were convened, possessed an extent of real power which he was not slow to exercise on other fitting occasions. The intervention which, in process of time, conducted to ambitious pretension and undisputed sway, was usually manifested at the beginning under the form of advice or amicable exhortation.

Law.

Law.

There are very early traces of the decisive pre-eminence asserted by the Church of Rome over all the other Christian churches. She was considered as the rule and type of orthodoxy. Eusebius, in his *Ecclesiastical History* (v. 6), makes mention of a letter written in the first century from the Church of Rome to the Church of Corinth, to maintain the peace of the latter; and the same author (v. 24) relates circumstantially the manner in which the bishop of Rome conducted himself, towards the end of the second century, in a discussion on the solemnization of Easter (See Ranke, *Geschichte der Päpste*, i. p. 12, cited by Falck, *Juristische Encyclopädie*).

The idea of the separate unities of Church and State gained ground. Each was to subsist apart, by the side of the other, with independent but analogous systems of government. Even when the temporal and spiritual authorities were united in the same hands, they were regarded as distinct in conception. To use the language addressed by Justinian to Epiphanius, archbishop and patriarch of Constantinople, *Maxima quidem in hominibus sunt dona Dei à superna collata clementia, SACERDOTIUM et IMPERIUM: et illud quidem divinis ministrans, hoc autem humanis præsidens, ac diligentiam exhibens, ex uno eodemque principio utraque procedentia, humanam exornant vitam* (Nov. vi. pr.).

If such were the doctrines recognized in the Eastern empire, the same notions were practically influential in the West, where the spiritual power maintained an orderly existence amid the anarchy and revolutions of the temporal government.

Sources of canon law.

Based upon the notion of the distinct existence and governing power of the Church, a system of rules (*canones*) grew up, derived partly from custom, partly from a kind of direct legislation, and partly from professional opinion. Ecclesiastical observance was founded sometimes merely on reason or convenience; it rested in part on the authority of holy writ, or on early tradition; and sometimes it referred to the writings of the fathers, to the opinions of learned doctors, to the express resolutions of councils and synods, to the determinations of the highest authorities in the Church, to the decretal letters of popes, deciding questions, and establishing laws for the future. The system of rules thus formed has obtained the collective name of the Canon Law.

We have seen that the earliest canon law was administered between parties belonging voluntarily to the Christian Church, and not bound to submit to ecclesiastical jurisdiction. It was not sanctioned by civil penalties; it could not set in motion the temporal sword. It relied for its efficacy on the deprivation of spiritual advantages, and the censures of the Church. But the jurisdiction which was voluntarily submitted to when the civil power was wielded by pagan emperors, was not resigned when, through the conversion of Constantine, Christianity became the dominant religion of the Roman empire.

At first, the jurisdiction of the ecclesiastical authorities was limited to matters concerning religion. Afterwards, effect was given to those judgments touching temporal matters which were pronounced in the case of ecclesiastical persons who bound themselves to submit to the adjudication of the ecclesiastical authorities. Even laics, by consent, *præunte vinculo compromissi*, might oblige themselves to obey the sentence

of the bishop (See Nov. Valent. III. lib. ii. tit. 35, A.D. 452). Justinian altered this state of the law by giving to the bishop, in the first instance, without the consent of the litigating parties, the power of trying temporal causes in which the defendant was an ecclesiastical person. There was still, except in a few cases, an appeal to the ordinary tribunals (See Nov. 123, c. 21-23). At a later period of ecclesiastical history the spiritual tribunals in some countries enlarged their pretensions, and assumed the cognizance of all causes touching either an ecclesiastical matter or an ecclesiastical person. Thus it was that the canon law was extended far beyond its original sphere, and its domain became nearly concurrent with that of the civil law, from which it borrowed many important provisions.

The most general branch of the canon law is that which has been admitted by the Church of Rome, and prescribed for general use. Of portions of this Roman canon law certain authorized collections have been made, which form part of the volume entitled *Corpus Juris Canonici*. These authorized collections, with some modifications, have been adopted by the Roman-catholic states of Europe, and even, to a considerable extent, by countries in which reformed churches are established. But there are parts of the Christian Church which never admitted the supremacy of the Roman see. The Greek Church has canons of its own, and the churches of separate countries in communion with the papacy have also a special canon law, enacted with reference to their peculiar wants and circumstances.

Some of those who profess to give an historical account of the canon law divide it into three periods, the ancient, the middle, and the modern. The ancient begins with the first and ends before the middle of the ninth century, when the collection of canons attributed to Isidore Mercator, or Peccator, made its appearance. The middle begins after that event and ends with the Council of Pisa in 1409. The modern begins after that council and ends with the present time (See Butler, *Horæ Juridicæ Subsecivæ*, p. 106).

To the most ancient period of canon law are to be referred the Apostolic canons, a collection of ecclesiastical rules, which were probably for the most part in force before the Council of Nice in 325, though their claim to Apostolic authority is unwarranted. Of these canons the first fifty only have been admitted by the Latin Church, while the Greek Church recognizes as authentic thirty-five more.

In the most ancient period all the considerable synods were held in the East, and their resolutions were set forth in Greek; but the authority of the Greek canons was admitted in the West, and they were early translated into Latin. Until after the synod "in Trullo," held at Constantinople in 691, the Greek canons, in consequence of the bond of union which subsisted between the Greek and Latin churches, were the chief constituents of the ecclesiastical law of the West. One of the earliest Western collections was that which was made by Dionysius Exiguus, about the year 525. It was divided into two parts, the first consisting of a translation of Greek canons, the second of a collection of decretal letters by the bishops of Rome. The work of Dionysius was soon raised to the rank of a code for the Western church; but it received alterations from time to time, especially in the second part. The printed editions present this collection in the state in which it existed at the end of the eighth century, when

Pope Adrian gave the Emperor Charlemagne a copy of this *Codex Canonum* (*Codex Hadrianeus*). It was published by Pithou (Paris, 1687, fol.), under the title *Codex Canonum vetus Ecclesiæ Romanæ*.

The early canons of the Greek Church, of a date subsequent as well as anterior to its rupture with the Church of Rome, are contained in the valuable collection of Bishop Beveridge, published at Oxford, in 1672, in two folio volumes. The literary history of the early Greek collections has been carefully illustrated by Biener, in his work *De Collectionibus Canonum Ecclesiæ Græcæ* (Berlin, 1827).

Canons
of the
Spanish
Church.

After the collection of Dionysius the Little, other private compilations of canons were formed and circulated in various parts of the Christian world. Of these, the most important was a collection designed for the use of the Church of Spain, and generally attributed to the learned Isidore, who was bishop of Seville from 595 to 636. It was considered by Andreas Burriel, a Jesuit, who prepared an edition for publication, to have been the most pure, the most copious, and the best arranged which ever existed in any of the churches of the East or West; and, according to the same authority, the Church of Spain was invariably governed by it, until the close of the 15th century.

Middle
period of
canon law.
The
pseudo-
Isidorian
collection.

About the year 811, this collection was brought from Spain into France by Riculphus, bishop of Mayence; and it was not long before copies of a work now called the collection of Isidore Peccator, or Mercator, were diffused throughout Europe. Mercator is probably a corruption of Peccator, for bishops, with conventional humility, were accustomed to subscribe themselves "sinners," and the collection we are speaking of was probably at first passed off as the genuine collection of the bishop of Seville. It professed to contain the decretals of several contemporaries of the Apostles, and letters of almost all the popes from St. Clement to Sylvester. It abounded in tokens of forgery; but, in the age in which it was produced, the science of criticism was too little advanced to enable ordinary men of letters to detect the imposition. The maxims which it inculcated were favourable to the high pretensions of the Roman see. In the false decretals it was maintained that the pope alone had the right of convening councils; that he alone was judge in the last resort, where bishops were concerned; that he alone could translate bishops, and alone erect new bishoprics; that, in a word, it was within the scope of his power to alter any sentence pronounced by any tribunal, ecclesiastical or civil.

Some of the popes, cognizant of the forgery, or suspecting its existence, may have given countenance to the imposition, in order to extend their temporal power; others, finding the false decretals established by a formidable weight of authority, may have been reluctant *quieta movere*, or obliged in conscience to sustain the principles which were supported by so much evidence, and were so positively asserted to have emanated from the golden age of Christianity. For seven centuries after the first appearance of the collection, neither its authenticity nor its authority appears to have been questioned. It was first attacked by Marcillus of Padua, then by Cardinal Nicolas of Cusa, during the council of Basil, and afterwards by Erasmus. Writers of all religious persuasions were forced to acknowledge that it contained much which was spurious. It was given up by the Centuriators of Magdeburgh, by Bellarmine,

Law.

Van Espen, and Fleury. Even the author of the celebrated treatise, *Quis est Petrus?* (2nd edit. Ratisbon, 1791), though he be one of the ablest and most strenuous supporters of the papal prerogatives against the doctrines of the Sorbonne, is obliged to admit that the decretals of Isidore Peccator have been so far proved to be falsified that when they stand alone they are of no authority. By certain protestant writers the "crafty merchant" has been indiscriminately decried, with his thirty decretal epistles bearing the name of primitive bishops of Rome, and brought in, like "so many knights of the post," in a row, "to bear witness of that great authority which the Church of Rome enjoyed before the Nicene fathers were assembled" (See Usher, *Answer to a Challenge made by a Jesuit in Ireland*, London, 1631, p. 12). One of the most famous opponents of Isidore Peccator was David Blondel, in his work entitled *Pseudo-Isidorus et Turrianus Vapulantes* (4to, Genève, 1628).

It seems now to be ascertained that the collection of Isidore Peccator is in reality the Spanish collection probably made by Isidore of Seville, with some interpolations and the addition of some genuine and some spurious decretals, tending for the most part to relax the dependence of bishops upon their provincial superiors, and to extend the authority of the apostolic see of Rome. Whether the forgeries were the work of Riculphus is doubtful. Walter, in his *Lehrbuch des Kirchenrechts* (9th edition, Bonn, 1842), enters at large into the question, and comes to the conclusion that the spurious collection is due to Benedictus Levita of Mayence.

The pseudo-Isidorian collection is published in the first part of Merlin's *Decreta et Concilia* (Paris, 1523). The greater part of it is incorporated in the *Decretum* of Gratian, which forms the first book of the *Corpus Juris Canonici*.

M. De la Serna Santander, keeper of the Royal Library at Brussels, in the catalogue of his own library, printed in 1799, tom. i. p. 72, makes mention of a manuscript work which he possessed, in four volumes folio, containing the genuine Spanish collection revised by Andreas Burriel, *et ad fidem MSS. Cod. venerandæ antiquitatis exacta et castigata*. On the margin of this MS. are marked the various readings of several old manuscripts on vellum, of the 9th, 10th, and 11th centuries, preserved in the archives of the churches of Toledo, Girone, and Urgel, and in the royal libraries of Madrid and the Escorial. The Spanish manuscripts agree with each other, and are quite free from those errors and anachronisms which may be detected in the subsequent interpolations.

M. De la Serna Santander formed the intention of publishing the true collection of Isidore, as edited by the Jesuit Burriel, and for that purpose prepared a very interesting preface, in 114 pages 8vo, which was printed in 1803 in a supplement to his catalogue; but he was prevented by circumstances from completing his original design; and in 1809 his library, comprising the four MS. volumes of Burriel, was dispersed by sale. The genuine canons, however, have been since published at Madrid, in 1808 and 1821, in two volumes folio, with a preface by Gonzalez.*

Law.

The first volume of a work professing to contain the genuine Spanish collection had been previously printed at Rome, in 1739, under the editorship of Cajetano Cenni; but it seems that Cenni mistook a mere abridgment of that collection for the collection itself; and his work remains uncompleted. In the 6th volume of *Notices des Manuscrits de la Bibliothèque Nationale*, Paris, An. 9 (1801), is a paper by Camus on the pseudo-Isidorian canons; and in the 7th volume of the same work is an essay by Koch on a code of canons written by the direction of the bishop Rachion of Strasburg, in 787.

Compila-
tions pre-
vious to
the *Decre-
tum Gra-
tiani*.

Between the end of the 9th and the middle of the 12th century, several compilations of canon law were published, not, like the former collections of the Western churches, consisting of unmutated original documents, arranged in chronological order, but of ecclesiastical rules, extracted from the authoritative text, and arranged according to the order of subjects. This method had been followed in the Eastern empire, in ecclesiastical as well as civil law, ever since the age of Justinian, and was acceptable, especially to superficial readers, from its superior brevity and convenience. Among the most important collections of this class are those of Regino (915), Burchardi (1025), and Ivo of Chartres (1115). How much, in this country, the civil lawgivers of Anglo-Saxon times, and even of times subsequent to the Norman conquest, were indebted to the collections of Isidore and other ecclesiastical compilers antecedent to Gratian, appears to us not to have been fully understood by some of the modern editors of our ancient laws. We believe that the scraps of Roman jurisprudence, and the mutilated extracts from Cicero and other classical authors, which occur in the ancient English laws, were introduced at second hand through a canonical medium.

Formation
of the *Cor-
pus Juris
Canonici*.
The *Decre-
tum* of
Gratian.

All the compilations of ecclesiastical law of which we have hitherto spoken were eclipsed and superseded by the work of Gratian, a monk of Bologna. "He was a native," says Dr. Irving (*Introd.* p. 231), "of Clusium or Chiusi, near Florence; and, according to a very improbable account, was the brother of Petrus Lombardus and Petrus Comestor. One of these three individuals was a native of Tuscany; another, as his name denotes, of Lombardy; and the third, of France; but, in order to remove the difficulty which arises from this variety in the places of their nativity, some writers do their mother the honour of supposing that her three distinguished sons were the fruit of her unlawful intercourse with three different fathers, at different periods and in different places." His compilation was undertaken about the year 1140, probably at the instigation of St. Bernard, in order that the canon law might become, as the Roman law had lately become, an object of fashionable study and interpretation in the school of Bologna. In this object the author was successful. His work, originally called the *Concordantia Discordantium Canonum*, and afterwards *Corpus Decretorum*, or *Decretum Gratiani*, or simply *Decretum*, became a text for academical instruction, and was loaded, like the Imperial Law, with a copious gloss. In this celebrated collection there are many errors. Towards the middle of the 16th century Antonius Demochares and Antonius Contius published a corrected edition of it. A still more correct edition we owe to the Council of Trent. By a decree of that council it was ordered that accurate editions of missals, breviaries, and other

*Recensio
Romana*.

books relating to ecclesiastical matters, should be published. In consequence of this decree, Pope Pius IV. engaged several learned men in the revision of Gratian's compilation. The revision was continued through the pontificate of Pius V. Gregory XIII., the immediate successor of Pius V., when a cardinal, had been employed in the task. Under his auspices, a revised edition was finally published in the year 1580. Several faulty passages still remain in the work. Many of them have been pointed out by Antonius Augustinus, archbishop of Tarragon, in his learned and entertaining dialogues on the emendation of Gratian (*See Butler, Horæ. Jur. Subsec.* p. 114). The compilation of Gratian, without receiving any formal sanction, soon obtained universal authority in the Western Church. The first formal recognition of it was given by the bull of July 1, 1580, a memorable era in canon law, when the whole *Corpus Juris Canonici*, according to the *Recensio Romana*, completed by the 35 *correctores Romani*, in the time of Gregory XIII., was declared authentic.

Law.

The materials of Gratian's collection are drawn, for the most part, not directly from the sources but from preceding collections. The extracts, however, are preceded by inscriptions referring to the original sources whence they are severally taken. In some respects, the work may be compared to the *Pandects* of Justinian; but it differs in this respect, that, besides extracts from preceding authorities, it contains the personal observations of the author. Indeed, the *dicta Gratiani*, in the parts where they occur, are the texts, and the extracts which follow are the *pièces justificatives*. Many of the extracts or canons are entitled *Paleæ*, a name which has given rise to much doubt and conjecture. It is now ascertained that they were *addenda*, introduced into the *Decretum*, very soon after its publication, by one Paucapalea. The spirit of the *Decretum* is favourable to the pretensions of the papacy. "To the compilations of Isidore and Gratian," says the Catholic Butler, "one of the greatest misfortunes of the Church, the claim of the popes to temporal power by divine right, may in some measure be attributed. That a claim so unfounded and so impious, so detrimental to religion and so hostile to the peace of the world, should have been made, is strange; stranger still is the success it met with."

Soon after the collection of Gratian, a want was felt of supplementary compilations, of which many were published; but there were five of these which gained especial celebrity, from being honoured with a gloss, and taught in the school of Bologna. They were made respectively by Bernardus Papiensis (of Pavia), Johannes Galensis, Petrus Beneventanus, Innocent III., and Honorius III. The multitude of collections brought on the necessity of a new consolidated work, and accordingly Pope Gregory IX., in 1234, commissioned his chancellor, St. Raymond of Pennafort, to undertake the task. The five collections were embodied in this. It contains not only the decretal letters issued since the work of Gratian, but many of more ancient date, together with extracts from the canons of councils, and the writings of the fathers. St. Raymond was permitted to take the same liberties with ancient canons that Tribonian had taken with ancient constitutions of emperors. The compilation was executed greatly to the satisfaction of his

The five
collections.

The *De-
cretals* of
Gregory
the Ninth.

Law. Holiness, was published with formal sanction, and other similar compilations were forbidden. It became the commencement of the second portion of the *Corpus Juris Canonici*, and, like the *Decretum*, ere long received a *glossa ordinaria*. The full title is *Libri Quinque Decretalium Gregorii Noni*.

Liber Sextus Decretalium. The school of Bologna soon wanted a further collection. The spirit of research was awakened, and litigation was not inactive. To supply the demand, Boniface the VIII., in 1298, caused to be published, as a supplement to the five books of the *Decretals* of Gregory, a work which followed the same arrangement, and handled the subjects treated of much in the same manner. This work was called *Liber Sextus Decretalium*, or simply *Sextus*.

Clementine Constitutions. The following pope, Clement V., caused another collection to be made, which is known under the name *Clementine Constitutions*, or simply *Clementine*. It is sometimes called *Liber Septimus Decretalium*, and must not be confounded with another work under that title, compiled by Peter Matthæus, in 1590, and inserted in some editions of the *Corpus Juris Canonici*. The *Clementines* were sent by John XXII., in 1317, to the University of Bologna, where, like the *Sextus*, they received a gloss, and were accepted as an official text. The *Decretals* of Gregory the IX., the *Sextus*, and the *Clementines*, form the three parts of the second grand division of the *Corpus Juris Canonici*: they are usually known by the collective name of the *Decretals*,—a name which must not be confounded with the *Decretum* already described. The *Decretals* may be considered analogous to the *Code* of Justinian. In the revision of the *Corpus Juris Canonici* under Gregory XIII., the *Decretals* underwent a critical review, but were not altered and improved like the *Decretum*. For practical use, they are now the most valuable part of the general canon law.

Reception of the *Corpus Juris Canonici* beyond the dominions of the pope. Here ends the authoritative *Corpus Juris Canonici*, generally recognized by the European states, who received their law from the school of Bologna. The additions, now called *Extravagantes*, were made subsequently, and were declared to be authentic by Gregory XIII. in 1580; but the canon law had then ceased, according to the theories of continental jurists, to be susceptible of sudden increase; since its legal force, beyond the pope's own dominions, depended upon gradual customary adoption, or upon an ancient reception *en masse*, of which no repetition was possible.

The *Extravagantes Joannis* and *Extravagantes Communes*. At first, every collection of canon law, except the *Decree* of Gratian, was ranked among the *Extravagantes*. The name finally remained with the *Extravagantes* of John XXII. and the collection called *Extravagantes Communes*. The former contains decretal letters of John, distributed into fourteen titles by Jo. Chappuis. Twenty decretal letters of John XXII. had been previously published, with a gloss by Zenzelinus de Casanis, in 1325. The latter is a collection of subsequent *Decretals*, of which the most modern is one of Sextus IV., of the year 1483. It was made by Jo. Chappuis, and published soon after 1483. A subsequent edition, with some additions, appeared in 1503. The *Extravagantes* may be compared to the *Novells* of the *Corpus Juris Civilis*.

The *Institutes* of Lancellotti. To most editions of the *Corpus Juris Canonici* is appended the *Institutiones Juris Canonici* of Lancellotti. This work, first published in 1563, a few months before the dissolution of the Council of Trent, has never re-

ceived official sanction, although it was undertaken with the approbation of Paul IV., and, by the permission of Pius V., obtained a place in the *Corpus*. From its resemblance to the *Institutes* of Justinian it completes the analogy between the *Corpus Juris Civilis* and the *Corpus Juris Canonici*. This is an interesting and well-written little treatise, and its value is increased by the excellent notes of Doujat (Paris, 1685, and Venice, 1740).

The most prized edition of the *Corpus Juris Canonici*, with the gloss, is that of Lyons, 1671. The other editions of principal note are—(1) that of the brothers Pithou, of which the best impression is that of Paris, 1687; (2) that of Boehmer (Halle, 1747); (3) that of Richter (Leipzig, 1833-8).

We proceed to explain the manner of citing the different parts of the *Corpus Juris Canonici*, which, at first view, is rather more complicated and enigmatical than that which is in use for the *Corpus Juris Civilis*.

The *Decretum* is divided into three parts. The first contains 101 sections, called *Distinctiones*, and treats of the origin and different kinds of law, and particularly of the sources of ecclesiastical law; of persons in holy orders, and the hierarchy. The second treats of 36 particular cases (*causæ*), out of which questions of law (*quæstiones*) arise. The solution of these questions is given in the extracts. *Causa XXXIII.*, *Quæstio III.*, of the second book, constitutes a special treatise concerning penance (*de pœnitentia*), and is subdivided into seven *distinctiones*. The third book is entitled *De Consecratione*, and contains canons relating to the consecration of churches, the sacraments, and the celebration of divine service. It is divided into five *distinctiones*. It is remarkable that the *dicta Gratiani* are entirely wanting in the third part. Each separate extract is marked by the letter C., which stands for chapter (*caput*, *capitulum*), not, as it is ordinarily read, for canon. The whole contains about 3000 canons or chapters. In the early MSS. and editions of the *Decretum*, the larger divisions are numbered, but not so the chapters; hence the latter were necessarily cited by initial words. The first part was thus anciently cited: 1 *d. lex*, meaning the chapter beginning with the word *lex* in the first distinction. This is now numbered c. 3, and the fuller modern mode of citing would be, 1 *dist. c. 3, Lex*. The second part is thus cited: 3. *qu. 9, caveant*; or more fully, 3. *qu. 9, c. 2, caveant*; meaning, cause the third, question the ninth, canon or chapter the second. The 33rd cause and third question is cited in a peculiar manner, thus—*De Pœnit. d. 2, Radicata*. The same passage might be otherwise referred to, thus—33. *qu. 3, dist. 2, c. 2*. The third part is cited like the first, with the addition of the words *de consecratione*, thus: *de consec. d. 2, quia corpus*. This means the 35th chapter or canon (which begins with the words *quia corpus*) of the second distinction of the treatise *de consecratione*, which is the third part of the *Decretum Gratiani*. As the *Decretum* long stood alone, it is understood to be cited when there is no distinctive mark to denote a reference to other portions of the *Corpus Juris Canonici*. It is upon the same principle that the *distinctiones* of the first part of the *Decretum* are denoted simply by the letter *d*, while to the *distinctiones* in the second and third parts are respectively prefixed the specific symbols *de pœnit.* and *de consec.* We have seen that there is usually no

Law.

Editions of the *Corpus Juris Canonici*.Mode of citing the *Corpus Juris Canonici*.

Law.

mark to denote *causa*,* and that a mere number followed by *qu.* was considered a sufficient reference to a *causa* of the second part of the *Decretum*. Such is the explanation of a wretched technical system of citation, which seems designed to puzzle the uninitiated.

The *Decretals*, we have seen, consist of three parts—Gregory's, the *Sext*, and the *Clementines*. Gregory's *Decretals* (which are sometimes exclusively designated when the *Decretals* simply are spoken of) are divided (like the collection of Bernardus Papiensis, which they superseded) into five books, the contents of which are denoted by the verse—

Judex, Judicium, Clerus, Sponsalia, Crimen.

Each book is divided into titles with rubrics, and the titles are subdivided into chapters with *inscriptiones*. The *Decretals* of Gregory, having been the first collection that wandered beyond the *Decretum*, were originally denominated *extravagantes*, and they are still denoted in citation by the word *extra*, or the letter *X*, though the name *extravagantes* has been transferred to later compilations. Gregory's *Decretals* are usually cited by the chapter and title, without any reference to the number of the books. The varieties in the modes of citation are similar to those which we have explained in treating of the references to the *Pandects*. Thus *c. cum contingat X. de Offic. et Pot. Jud. Del.* is the 36th chapter, beginning with *cum contingat*, of the title in Gregory's *Decretals*, which is inscribed *de officio et potestate judicis delegati*; and which, by consulting the index, we find to be the 29th title of the first book.

The canonists seem to have been fond of the number five. The *Sext*, or sixth book of the *Decretals*, is itself divided into five books of the second order. The *Clementines* also consist of five books, the fourth book consisting of only three or four lines. The subdivisions of the *Sext* and *Clementines* resemble those of the *Decretals* of Gregory. The mode of citation, too, is similar, and admits of similar varieties; only, instead of *extra*, or *X*, there is subjoined in *Sexto*, or in 6, in references to the *Sext*, and *Clem.* or in *Clem.*, in references to the *Clementines*. Thus *c. Si gratiose 5, de Rescript. in 6*, is the fifth chapter, beginning with *si gratiose* of the title *De Rescriptis* in the *Liber Sextus Decretalium*,—the title with that rubric being the third of the first book. Again, *Clem. 1 de Sent. et R. J.*, or *ut calumniis, 1, de Sent. et R. J. in Clem.*, is the first chapter of the *Clementine Constitutions*, under the title *De Sententiâ et Re Judicata*,—which chapter begins with *ut calumniis*, and belongs to the eleventh title of the second book.

The *Extravagantes* of John XXII. are contained in one book, divided into fourteen titles. They are cited thus: *Extravag. ad conditorem, Joh. 22 de V. S.* This means the chapter beginning with *ad conditorem* of the *Extravagantes* of John XXII.,—title *De Verborum Significatione*, which is found to be the 14th title.

The *Extravagantes Communes*, in imitation of Gregory's *Decretals*, are divided into five books, though the fourth book is a blank! *Quartus Liber vacat!*—The mode of citation may be thus exemplified: *Extravag. Commun. c. Salvator de Præbend.* This means the chapter beginning with *Salvator*, in the title *De Præbendis*, among the *Extravagantes Communes*. There

* *Causa*, by the moderns, is often denoted by a capital *C*; the small *c* being still reserved to denote *caput*.

is no constancy in the position of the references to the larger or smaller divisions. Sometimes the rubric of the title precedes, sometimes follows, the initial words of the chapter. We have given, with some additions and explanations, the examples of citation which are contained in a note to the first chapter of Halifax's *Analysis of the Civil Law*, b. i.

In the modern period of canonical law, less alteration and advance have been made than in the ancient or the middle. While the ancient is chiefly signalized by the canons of the Greek Church, and the middle by the formation of the *Corpus Juris Canonici*, the modern, commencing after the Council of Pisa, in 1409, is remarkable chiefly for a few councils, among which the councils of Basil and Trent are the most important for some bulls and briefs of the popes, the transactions and concordats between sovereigns and the see of Rome, the sentences and ordinances of the various congregations of the cardinals at Rome, and the decisions of the *Rota*, the supreme tribunal of justice in Rome both for spiritual and temporal concerns.

All these are merely continuations of sources of canon law which existed in more ancient times; and no one can presume to call himself an accomplished canonist who rests contented with the extracts of the *Corpus Juris Canonici*, instead of resorting to the authorities whence they are taken. Of these, the most important are the transactions of councils. The earliest collection of councils is that of Merlin (Paris, 1523); the collection best known in this country is that of Labbe and Cossart, with the apparatus of Jacobatius (18 vols. fol. Paris, 1672). More complete is the collection of Coleti, with the Supplement of Mansi (31 vols. fol. Venice and Lucca, 1728–52). The most copious collection of all is that of Mansi, printed by Zatta (31 vols. fol. Florence and Venice, 1759–98). The 31st volume of this collection stops short some time before the middle of the 15th century. Chronological and alphabetical lists of councils, abridged from the excellent *L'Art de vérifier les Dates*, are given in the useful little book of Sir Harris Nicolas, entitled *Chronology of History*. Among the councils held since the Council of Pisa, in 1409, are that of Constance, 1414, and that of Basle, 1431. Of much greater consequence than these is the famous Council of Trent, 1545. Its history has been often written; it will be sufficient here to name the celebrated and opposing histories of Fra Paolo Sarpi and Sforzia Pallavicini. The translation into French of the former by Le Courayer is more valued than the original. The best edition is that of Paris, 1751, 3 vols. 4to. "The classical purity," says Charles Butler, "and severe simplicity of the style in which the decrees of the council are expressed are universally admired, and are greatly superior to the language of any part of Justinian's law." The best edition of the *Canones et Decreta Concilii Tridentini* is that of Rome, 1834. It has been reprinted (Leipz. 1837) as a supplement to the *Corpus Juris Canonici* of Richter. A preceding edition, of Augsburg, 1781, contains, in addition, the declarations of the *Congregatio Cardinalium, Concilii Tridentini interpretum*, and the decisions of the *Rota Romana*. There have been several collections of the bulls of popes: the best known is the *Bullarium Magnum*, published at Luxembourg, 1727–58, in 19 vols. fol. We know of no separate and complete collection of concordats; but for the names of treatises relating to some of the modern concordats, we would refer the reader to the

Law.

Law.

Bibliothèque de Droit of Camus, which is particularly copious in its information with respect to French works on ecclesiastical and canon law.

Into the detailed examination of the particular canon law of the several nations of Christendom we are unable here to enter. Some of the ecclesiastical laws of Rome are not intended for general adoption, but are designed only for the dominions of the papacy; others, intended to be general, have been by some countries rejected, or only partially received. The struggles which have been made in various Roman Catholic countries for the liberties and independence of their respective national churches fill some interesting chapters in ecclesiastical history. Canon law verges not only upon ecclesiastical history but upon dogmatic theology. It prescribes articles of faith as laws; it looks upon offences rather as sins than as crimes; and it holds forth punishments *pro salute animæ*. Of those branches of the Roman canon law which are intended to be general, some parts relate to matters of faith, some merely to matters of practice and discipline. The former are generally received by Roman Catholic countries, whereas the reception of the latter is variable and limited. If to give an account of the reception throughout Europe of the Roman canon law exceed our limits, still more is it inconsistent with the plan of so slight a sketch as the present to delineate the internal legislation of each national church. We must confine ourselves to a few words respecting the state of our own canonical law.

The canon
law of
England.

The canon law of England may be classed under two heads, foreign and domestic.

The foreign canon law of England consists of so much of the general canon law of Rome as has become incorporated into the English system by usage and by its reception in particular cases. Its efficacy rests upon the same foundation with the efficacy of those portions of the imperial civil law which have been adopted by usage in the Court of Admiralty. For example, by such usage and recognition, there are canons of the fourth Council of Lateran which have become part of the canon law of the land (*See Alston v. Atlay*, 7 Ad. & El. 289).

The domestic canon law may be divided into the canons anterior to the statute 25 Henry VIII., cap. 19, and the canons subsequent to that statute. We omit, as antiquated, the Anglo-Saxon canons.

The canons anterior to the statute 25 Henry VIII., cap. 19, consist of legatine and provincial constitutions.

The legatine constitutions were made in national councils held within this realm, in the time of Otho, legate of Gregory IX., in 1220, and of Othobon (afterwards Pope Adrian V.), who was legate here under Clement IV. in 1268. They were edited, with a gloss, by John de Athona, canon of Lincoln, about 1290. They extend to both provinces, Canterbury and York.

The provincial constitutions were made in convocations of the clergy of the province of Canterbury, in the times of various archbishops, commencing with Stephen Langton, under Henry III., and ending with Henry Chichele, under Henry V. These were collected, and adorned with the learned gloss of William Lyndwood, official of the Court of Canterbury, and afterwards bishop of St. David's, in the reign of Henry V. Although made only for the province of Canterbury, they were received also by the province of York, in convocation, in the year 1463.

VOL. II.

Law.

There were other constitutions, of divers prelates, both before and after; but these which have been mentioned, having been introduced to public notice by the two learned canonists above mentioned, have been principally regarded (*See Burn's Ecclesiastical Law*, Preface).

The printed editions of Lyndwood's *Provinciale* contain also the collection of John de Athona. The latest edition is that of Oxford, 1679.

By the statute 25 Henry VIII., cap. 19, after the following recital—

“Where divers constitutions, ordinances, and canons provincial or synodal, which heretofore have been enacted, be thought to be not only much prejudicial to the king's prerogative royal, and repugnant to the laws and statutes of this realm, but also over much onerous to his Highness and his subjects,”—

It was enacted, that the said canons, constitutions, and ordinances, provincial and synodal, should be revised by a commission of thirty-two persons, to be appointed by the king; and that such of them as should be disapproved by the majority of the commissioners, upon such review, should from thenceforth be void and of none effect;

“Provided that such canons, constitutions, ordinances, and synodals provincial, being already made, which will not be contrariant or repugnant to the laws, statutes, and customs of this realm, nor to the damage or hurt of the king's prerogative royal, shall now still be used and executed as they were afore the making of this Act, till such time as they be viewed, searched, or otherwise ordered and determined by the said two-and-thirty persons, or the more part of them, according to the tenor, form, and effect of this present Act.”

Upon this, Sir W. Blackstone (1 *Com.* p. 83) observes, “As no such review has yet been perfected, upon this statute now depends the authority of the canon law in England.”

The words of Blackstone, in this passage, are not expressly limited to the *domestic* canon law of England, although in a former page (p. 89) he expressly rested all the strength of the *papal* laws in England (so far as they had not parliamentary sanction) “on immemorial usage and custom in some particular cases and some particular courts.” This is probably an example of that studied ambiguity under which Blackstone not unfrequently shelters himself in cases of difficulty; so that he may be quoted on both sides. “*Magno se judice quisque tuetur*.” To us it appears that the Act, according to legal principles of interpretation, extends only to domestic canon law; and we much doubt that the domestic canons used and executed afore the making of the Act, and not repugnant to law or prerogative,* derived any authority from the Act which they would not have possessed from reception and usage, if the Act had never been made.

It is to be observed, that traces still subsist of that ancient jealousy which severed the barristers of Westminster Hall and the advocates of Doctors' Commons. For example, Bishop Gibson's legal notions of ecclesiastical jurisdiction are very different from those of Blackstone, who has been accused by Mr. Bowyer, in his recent work on the English constitution, of an Erastian spirit. But Westminster Hall is armed with

* In the early history of our constitution, prerogative is often contrasted with law, not as being *illegal*, but as being beyond or above law.

Law.

the power of prohibition, and its doctrines must therefore be received as the sounder when they clash with those which are in vogue near St. Paul's.

Under a similar Act, since repealed (3 & 4 Edw. VI., cap. 11), the well-known *Reformatio Legum Ecclesiasticarum* was compiled, under the direction of Edward VI., but was not confirmed before his death and the accession of Queen Mary, and so fell to the ground.

The statute 25 Hen. VIII., cap. 19, was repealed by 1 & 2 P. & M., cap. 8, but was revived by 1 Eliz., cap. 1, and is now in force.

With the exception of certain rubrics,* the Thirty-nine Articles, and some regulations relating to the Common Prayer, which, though made in convocation, have been incorporated into the statute law by the several Acts of Uniformity, the only canons subsequent to the 25th year of Henry VIII. affecting generally the law of the ecclesiastical courts, and the rights, order, and discipline of the Church, were those which were passed in the convocation of the province of Canterbury, under James I., in the year 1603. These canons have never received parliamentary authority, but they were ratified by the king for himself, his heirs, and successors, and about the year 1605 were received and passed in the province of York.

With respect to the canons of 1603, it was held by Lord Hardwicke, in the case of *Middleton v. Croft* (Strange, 1056), that they do not, *proprio vigore*, bind the laity even in ecclesiastical matters. How far they are binding upon ecclesiastical persons, as the clergy, and *quasi* ecclesiastical persons, as churchwardens, appears to be not completely settled. Here, again, Sir W. Blackstone speaks with studied ambiguity: "It has been solemnly adjudged," says he (1 *Com.* p. 83), "upon the principles of the law and the constitution, that where they are not merely declaratory of the ancient common law, but are introductory of new regulations, they do not bind the laity, *whatever regard the clergy may think proper to pay them.*"

We believe the fact to be, that the ecclesiastical courts look to the canons of 1603—canons far more suited to the circumstances of the present times than the older canons which were made before the Reformation—as their rule in cases to which they are applicable, and that they are constantly cited in those courts. What length of usage will sanction the practice of a court—how far the constant adoption of a rule not opposed to any definite authority would be valid, though its origin might be traced to an unparliamentary canon of no very ancient date—these are questions which, though not unworthy of discussion, we shall not now stop to discuss. Many of the doctrines and practices which now prevail in our courts of common law and equity might easily be shown to be more recent than 1603, and to have no Act of Parliament for their warrant.

Among the more important repertories and treatises of English ecclesiastical law, we would mention (in addition to Lyndwood) Burn's *Ecclesiastical Law* (of which a valuable edition, by Dr. Phillimore, appeared London, 1842); Gibson's *Codex* (2nd edition, Oxford, 1761); and Wilkins' *Concilia Magnæ Britanniae et Hiberniae* (Lond. 1737). The last-named work has recently become expensive, and is not always easily to be met with.

* See Cardwell's *Synodalia*.

Canon law is not now generally studied upon the continent with the learning and diligence which formerly distinguished the canonists. The investigation of its principles has not, however, been neglected in modern times by Roman and Spanish writers; and a new stimulus was given to the pursuit in Prussia, towards the end of 1837, by the controversies connected with the suspension of the Bishop of Cologne. To those who may be content with a succinct account of its history and contents, we recommend the perusal of Doujat's *Histoire du Droit Canonique* (Paris, 1677); G. L. Boehmer's *Principia Juris Canonici* (8th edition, Göttingen, 1802); and Fleury's *Institution du Droit Ecclésiastique* (Paris, 1771). The excellent work of Fleury, however, is not confined to general canon law, but treats of the ecclesiastical law of France. It was placed in the Index by the Congregation of the Holy Office at Rome. Those who desire to penetrate more deeply into the subject are referred, in addition to the original sources, to Van Espen's *Jus Ecclesiasticum Universum* (Lovanii, 6 vols. fol., 1753). This work, for learning and historical accuracy, as well as for its practical utility and detailed exposition, has acquired the greatest celebrity among Roman Catholics. C. Butler characterizes it as "a work which, for depth and extent of research, clearness of method, and perspicuity of style, equals any work of jurisprudence which has issued from the press; but which, in some places where the author's dreary Jansenism prevails, must be read with disgust." That a Protestant should write upon canon and ecclesiastical law might seem an interference with a property rightfully belonging to others—

"O touch not Hector! Hector is my due"—

yet has J. H. Boehmer, in his *Jus Ecclesiasticum Protestantium* (5 vols. 4to. Halæ, 1756–1789), commented upon the *Decretals* with so much sagacity and clearness, that Camus criticises his work in the following manner: "*Il traite certains articles suivant les préjugés de sa communion; mais, par rapport aux objets sur lesquels les Protestans sont d'accord avec les Catholiques, il y a beaucoup à profiter de son jugement, de ses lumières, et de son érudition.*" Some authors have attempted to exhibit a kind of *natural* ecclesiastical law, by applying the light of reason to deduce propositions from the hypothesis of a church government, and from the elements contained in the notion of a church. On this subject may be consulted the treatise of Droste-Hülshoff, *Ueber das Naturrecht als eine Quelle des Kirchenrechts* (Bonn, 1822). Many of the most recent Roman-catholic writers on the canon law in Germany have comprehended in their works the ecclesiastical law of the Reformed Churches. As may well be imagined, modern canonists are still divided on the question of the relations which ought to subsist between Church and State; some being favourable to the rights of the Church within the State; others, to the dominion of the State over the Church. The two most popular German manuals of the present day belong to these opposite parties. Walter's *Lehrbuch des Kirchenrechts* (9th edition, Bonn, 1842) has been accused of Ultramontanism; while Eichhorn's *Grundsätze des Kirchenrechts* (2 Bände, 8vo; Göttingen, 1831, 1833) inclines to the principles which have been espoused by the Gallican Church.

Modern study of canon law.

LAW.

CHAPTER V.

THE LAW OF ENGLAND.

Law.
Preliminary observations.

270. IN considering a subject so vast in its extent as the law of England, it will be obviously impossible to do more, in a work of this kind, than indicate its general character, larger divisions, and more remarkable doctrines.

However scientific in its structure, the law of England is not a science; nor is it easy to lay down with any confidence its doctrinal principles, seeing that those principles are in so many cases restrained and limited in their operation. Sometimes this is effected by positive legislation, which necessarily disturbs the harmony and impairs the symmetry of every jurisprudential system; and sometimes it is the effect of a desire on the part of the courts to avert that injustice to individuals, which a rigorous and invariable enforcement of general principles could not fail to ensure. Another circumstance may be noticed as enhancing the difficulty of discussing our jurisprudence, in the brief and dogmatic fashion imposed by our limits. Unlike the Roman law and the modern codes of continental Europe, the law of England does not profess to be comprised within one volume, in which the solution of all legal questions is properly to be sought. For the most part, it is an aggregate of customs, maxims and doctrines, accidentally preserved by tradition, originating in a dim antiquity—of decisions of courts of justice and of opinions of learned lawyers—all challenging an authority inferior in no degree to the most recent and explicit declarations of legislative will.

So vast in its integrity, so complex in its parts, the law of England is not easily reducible to system, nor comprehensible within the space allotted to this chapter. The lawyer, therefore, will readily pardon omissions dictated by necessity; and all the more when he remembers that the very purpose of an essay, addressed to the general mind, forbids the use of those pregnant *formulae* and that significant nomenclature which secure in the scientific treatise both brevity and precision.

The subject may be distributed* under, (1) Public Law (*Jus publicum*); and, (2) Private Law (*Jus privatum*).

The first, Public Law, defines the position and operation of the sovereign power, the rights and duties of the subject, and the sanctions by which the enjoyment of those rights and the performance of those duties are secured and enforced.

The second, Private Law, determines the rights and duties of individuals in their capacities as such, whether as respects their mutual personal relations, or the acquisition, enjoyment and transfer of their property;

* A distribution authorized by Ulpian. *Hujus studii duæ sunt positiones, publicum et privatum. Publicum jus est quod ad statum rei Romanæ spectat; privatum, quod ad singulorum utilitatem* (Dig. 1. 1, 1, 2).

and constitutes sanctions vindicating the authority of its commands.

Law.

PART I.

The Public Law of England.

271. "The sovereignty of the British constitution," says Blackstone, "is lodged in the three branches of the legislature" (1 *Comm.* 51). By this term, sovereignty, is intended that supreme, absolute and irresponsible power in the state, to whose authority the obedience of every one is due, and the location of which determines the character and name of the government. In the view of English public law, this power, the source of all law, public and private, resides in the Parliament—in *hoc orbis terræ sanctissimo gravissimoque concilio*—a body consisting of three members, King, Lords, and Commons.

The presumed object which this power consults in its operation, is the increase of the physical and moral happiness of its subjects.* Such object every command of the supreme authority is supposed to intend. *Finis enim et scopus, quem leges intueri, atque ad quem jussiones et sanctiones suas dirigere debent, non alius est, quam ut cives feliciter degant* (*De Augm. Scient. lib. viii. cap. ii. aph. 5*). To obtain such an object, the sovereign power will protect life and property from violence, external and internal—will cherish domestic industry, encourage foreign trade, and whatever may tend to the increase of national prosperity—will, to the extent of its power, promote the social comfort and physical well-being of the people; and, acknowledging the claims and vindicating the authority of the church of Christ, will secure the means of enjoying religious instruction and consolation to all its subjects.

The operations, then, of the sovereign power may be presumed to relate to the following six subjects:—

I. Justice; II. Defence; III. Social Economy; IV. Foreign Relations; V. Finance; and, VI. Religion.

272. I. JUSTICE.—By justice, we understand the performance of that sacred duty, recognised alike by ethicist and jurist, *suum cuique tribuere* (*Inst. I. 1, 1*). To induce its discharge, the sovereign power, pursu-

* The ablest casuist of the Anglican church takes a similar view:—*Potestas autem publicæ jurisdictionis, ordinatur primariò in bonum publicum ipsius communitatis, in bonum vero personæ tali potestati præditæ, id est, ipsius magistratûs, non nisi secundario et consequenter, quatenus nimirum utile est principi, ut respublica floreat* (Sanderson, *De Oblig. Conscien. Prel. 7, s. 4*). And so says the church herself: "The government of a prince is a blessing of God, given for the commonwealth, especially of the good and godly; for the comfort and cherishing of whom, God giveth and setteth up princes, and on the contrary part, to the fear and punishment of the wicked" (*Homily 21, against wilful Rebellion and Disobedience. Homilies, p. 509. Oxf. 1822*).

Law. ing its own mission, creates and defines rights,* institutes appropriate sanctions, and provides arrangements by which its definitions are interpreted and applied, and its sanctions enforced. Its operations in this respect are — (I.) *legislative*, which involves the making of laws; and, (II.) *administrative*, which relates to the application and execution of such laws.

Legislation. (I.) Legislation† is the appropriate business of the Parliament, in quality of its sovereign authority. By this it can make, confirm, abrogate, repeal,‡ restrain, enlarge, revise, and expound all manner of laws whatever, and can bind the king and the people,§ and all

* That is, *legal* rights; giving, as we must presume, to moral rights the efficacy and force of legal obligation.

—As Nature's ties decay,
As duty, love, and honour fail to sway,
Factitious bonds—the bonds of wealth and law—
Still gather strength and force unwilling awe.

I have ventured to substitute *factitious* for *fictitious*, as more consistent with Goldsmith's meaning.

† By *legislation*, the French lawyers intend the articular or codified law, as distinguished from the law contained in judicial decisions. This last they style *jurisprudence*. (Dupin, *De la Jurisprudence des Arrêts*. Paris, 1822).

‡ No law is exempt from the liability to abrogation, even should it contain a provision to the contrary. The 42 Edw. III. cap. 2, enacted that all statutes contrary to Magna Charta should be void; yet portions of Magna Charta have been repealed, and the repealing statutes have been constantly held in force (Jenk. Cent. 2).

§ The doctrine that a parliamentary law, or act of parliament, as it is often called, is of supreme authority, dates its origin from the middle or transition age of our constitution. It is now firmly established that Parliament can do no wrong, although "it may do several things that look pretty odd," as, for example, making Malta in Europe, and a woman a mayor or a justice of the peace (*per* Holt C. J., 2 Jon. 12).

Language, to say the least of it, highly indiscreet, has been used by learned judges in derogation of the authority of Parliament, whilst in exercise of its chiefest function, legislation. Hobart C. J. declares that a statute against natural equity, making, for instance, a man judge in his own cause, was void (*Day v. Savage*, Hob. 87); whilst Lord Coke considered that statutes were controlled by the common or traditional law, which adjudged them void when against common right and reason (*Bonham's case*, 8 Rep. 234.) Holt C. J. expressed his belief that this saying of Lord Coke was not extravagant, but was a very reasonable and true saying (*City of London v. Wood*, 12 Mod. 687). It is further asserted, in a book of authority (8 Bing. 491), *The Doctor and Student*, that an act of parliament to prohibit alms-giving is void—a doctrine which, if true, would invalidate the Statute of Labourers (23 Edw. III.), which contains (cap. 7) a provision to that effect. Lord Chancellor Ellesmere styles Coke's position "a paradox, which derogateth much from the wisdom and power of parliaments, that when the three estates—King, Lords, and Commons—have spent their labour in making a law, three judges on the bench shall destroy and prostrate all their pains, advancing the reason of a particular court above the judgment of all the realm" (*Observations on Lord Coke's Reports*, p. 11). Sir William Herle, who was Chief Justice in the reign of Edward III., observed, that "some acts of parliament are made against law and right, which they that made them perceiving, would not put them into execution; for it is *magis congruum* that acts of parliament should be corrected by the same pen that drew them, than be dashed to pieces by the opinion of a few judges" (8 Edward III., cited 8 Rep. 234). When the assertion of Lord Hobart was once quoted in court, the judges observed, that they would not treat a statute as void unless it were clearly against natural equity, and that they "would strain hard" rather than treat it as void (10 Mod. 115). An act was passed in the reign of Charles II. "concerning the size of carts and wagons, with many penalties upon the transgressors; and yet, when it appeared that the model prescribed by the act was not practicable, the judges (in their circuits) gave directions not to execute the Act" (Burnet, *Hist. own Times*, 428. Lond. 1838). The counsel for the crown, in Sir Edward Hales' case, relied on this in their arguments for the dispensing power. It is not difficult to apprehend the conclusions to which these doctrines point; and

the inhabitants of the channel islands, Isle of Man, and all colonies and plantations to the realm belonging, being subjects of the same realm. By laws, we would be understood to mean such commands of the sovereign as are *rules* of action, excluding from the signification of the term, those commands which are called, in common parlance, laws, only because they resemble them in their formal parts—in short, in their mode of expression, such as money acts, acts of attainder, and others.

In point of *fact*, the corpus of English jurisprudence does not consist wholly of parliamentary laws; and this for several reasons. In the first place, legislation was a function the supreme power exercised in early times rarely and imperfectly; and thus customs, unauthorized in their origin, supplying the deficiencies of governmental legislation, came in time to acquire the authority and obligation of laws—*vetustas pro lege semper habetur*. Secondly, as far as we know, Parliament had not always the supreme power, or the right of legislation, which latter formerly resided in the prince, though probably under limitations and restrictions which we cannot now perfectly apprehend. Thirdly, the interpretations of the laws have been themselves accepted as laws—sources whence legal principles may be drawn, and authorities by which legal controversies may be determined.

Thus we have still subsisting the ancient traditional law, which was the jurisprudence of our early age, when, like the Romans before the Twelve Tables were composed, we were governed, *incerto magis jure et consuetudine aliquâ, quam per latam legem* (Dig. I. 2, 2, 1). We have also our ancient charters, and the volumes of our judicial decisions; and all these, as well as parliamentary laws, constitute what we designate the law of England. Still, although not *created*, these laws are *permitted* by the power, now supreme, and may be taken as deriving their *present* authority from its sanction, expressed or implied: *Qui non vetat, si potest, jubet*.*

The law of England† may be considered as a system

although, as we shall presently observe, our judges have often covertly, and to the advantage of the subject, defeated the intentions of the legislature, the establishment of the principles so broadly laid down by Coke, Hobart, and Holt would be destructive of the very foundations of our constitutional polity. These principles suggest two reflections.

(1.) Their source we can readily understand to have been the notion, which our early constitutional history warrants, and which long lurked in the minds of our lawyers, that a statute might supply the defects, but could not repeal the provisions of the common law.

(2.) The duty of a judge called on to administer a law he believes contrary to the law of God (taking an extreme case) is tolerably clear; and our history has not been wanting in examples of judicial firmness under such circumstances. To resign an office he cannot conscientiously serve is the plain dictate of conscience. As to the citizen, of whom it has been sarcastically said, that he has nothing to do with the laws but to obey them, his obedience is clearly measured by his conscience; but this measure must not be stretched beyond its legitimate extension. He conceives the command of his sovereign to conflict with the commands of his God. The command, then, of the sovereign he disobeys, but cheerfully endures the penalty annexed to such disobedience.

* This maxim is borrowed from that of Aristotle, who considers the law as directing that which it does not prohibit, *ἡ μὴ κελεύει, ἀπαγορεύει* (*Ethic. lib. 1. cap. 11*).

† The enlightened patriots of the Revolution knew that true liberty could consist only with wise laws, and, in declaring "the true ancient and indubitable rights and liberties of the people of this realm" (1 Wm. & M. stat. 2, cap. 2), were careful to assert them by a new law; "the laws of England" being, as they said on another occasion, "the birthright of the people thereof" (12 & 13 Will. III. cap. 2). Two philosophers—*magis pares quam*

Law. framed in reference to certain principles. Its operation, by its very nature, is to afford those principles protection. In their relation to the law, we style them *principles*; in their relation to those who owe allegiance to the law, we style them *rights*. They are fitly styled *principles*, scientifically speaking, because they are the ultimate facts into which all the phenomena of the law are resolvable. With equal fitness are they called *rights*, practically speaking, because they result from obligations imposed by competent, that is, sovereign, authority, and are guaranteed by adequate sanctions.

Protection. (1.) First, then, the law of England assures its *protection* to every English subject who has not, by his misconduct, forfeited his claim to such protection. Arbitrary power is here unknown. Here, the empire of the laws is a phrase of significant import. Except in conformity with law, no man can be outlawed, that is, "barred to have the benefit of the law;" nor exiled; nor can he, against his will, be sent, even as an ambassador out of the land (*Magna Charta*, cap. xxix.; 2 *Inst.* 47), nor, in any office, to any of the colonies, which might, in reality, be no more than an honourable banishment. In order the better to preserve to the people the benefits of the law, no subject, inhabitant here, can be sent prisoner to the channel islands or to any of our transmarine possessions (31 Car. II. cap. 2, s. 12), and thus deprived of legal protection.*

Personal security. (2.) Secondly, the law of England assures to every man the enjoyment of *personal security*, and suffers him to commit even homicide in defence of his life or limbs. No freeman shall be destroyed, except according to law (*Magna Charta*, cap. xxix.); none prejudged of life or limb contrary to law (5 Edw. III. cap. 3); nor put to death without being brought to answer by due process of law (28 Edw. III. cap. 3). So dearly is life tendered by our polity, that it protects it, by "strict statutes and most biting laws," not only from the hand of violence, but even from the effects of misfortune, in establishing a provision for the support of those unable to labour, or unable, in return for their labour, to obtain the means of subsistence.†

similes (Locke, *On Gov.* part ii. s. 57; Mackintosh, *Disc. Law Nat.* p. 59)—have established the wisdom of their proceedings, and exposed, at the same time, the folly of those pretenders to philosophy, who

"Led their wild desires to woods and caves,
And thought that all but savages were slaves."

* It was one of the articles of impeachment against Lord Clarendon, that he had advised and procured divers of his Majesty's subjects to be imprisoned, against law, in remote islands and garisons, to prevent their having the benefit of the law (Hume, *Hist. Eng.* App., note to chap. xiv.). To avoid the consequences of an *Habeas Corpus*, Harrington, that dreamy and amiable enthusiast, was, assuredly illegally, hurried off from the Tower to St. Nicholas' Island, opposite Plymouth (see his *Life*, by Toland; Harrington's *Works*, pp. 36 et seq. Lond. 1700). Evasions of the numerous laws passed to protect personal liberty were common in those times. In vain were the laws multiplied in every shape, to meet every possible case; the evil they were intended to repress continued in full vigour; just as bribery, in ancient Rome, survived all the legislative efforts to subdue it: *De nullo crimine tam multæ apud Romanos latæ leges, nec ullæ minus observatæ.*

† Louis XIV., in his advice to his son, observes: *Si Dieu me fait la grace d'exécuter tout ce que j'ai dans l'esprit, je tâcherai de porter la félicité de mon règne, jusqu'à faire en sorte, non pas à la vérité qu'il n'y ait plus ni pauvre ni riche, car la fortune, l'industrie, et l'esprit laisseront éternellement cette distinction entre les hommes, mais au moins qu'on ne voie plus dans tout le royaume, ni indigence, ni mendicité; je veux dire, personne, quelque misérable qu'elle puisse être, qui ne soit assurée de sa subsistence, ou par son travail, ou par un secours ordinaire et réglé.*

(3.) The *personal liberty* of its subjects is also regarded by the law of England. Except by law, no man shall be taken, imprisoned, exiled, or in any manner destroyed (*Magna Charta*, cap. xxix.); a provision of our Great Charter repeated in a variety of subsequent statutes, which in effect declare that no man shall be taken or imprisoned except by due process of law (5 Edw. III. cap. 8; 25 Edw. III. st. 5, cap. 4; 29 Edw. III. cap. 3). The Petition of Rights enacts that no freeman shall be imprisoned or detained without cause shown (3 Car. I. cap. 1), an enactment rendered of inestimable value by the *Habeas Corpus* Acts (16 Car. I. cap. 10; 31 Car. II. cap. 2; 56 Geo. III. cap. 100), the effect of which is to enable the individual detained or imprisoned to bring under the notice of an independent and enlightened judicatory the cause or alleged ground of his imprisonment or detainer, and, constituting the judicatory judges of such cause, to enable them, as they think fit, to remand him to his former custody, to discharge him, or to admit him to bail.* A gaoler is not bound to detain a prisoner unless the warrant of commitment express the cause thereof; "and this doth agree with that which is said in the holy history (*Acts*, xxv. 27), 'It seemeth to me unreasonable to send a prisoner, and not withal to signify the crimes laid against him'" (2 *Inst.* 53).

(4.) The law of England protects every individual in the *enjoyment* of his *property*. No freeman shall be disseised or divested of his freehold, deprived of his liberties, free customs, or franchises, nor disinherited, nor shall his lands or goods be seized into the king's hands, which is against the Great Charter and the law of the land, unless he be duly brought to answer, and be prejudged by course of law (*Magna Charta*, cap. xxix.; 5 Edw. III. cap. 9; 25 Edw. III. st. 5, cap. 4; 28 Edw. III. cap. 3). Sacred as the rights of property

"Political society," says an able American statesman, "owes perfect protection to all its members, in person, reputation, and property; and it also owes necessary subsistence to all who cannot procure it for themselves. Penal laws to suppress offences are the consequences of the first obligation; those for the relief of pauperism, the second: these two are closely connected; and when poverty is relieved and idleness punished—whenever it assumes the garb of necessity, and presses on the fund that is destined for its relief, the property and persons of the more fortunate classes will be found to have acquired a security that in the present state of things cannot exist" (Livingston, *System of Penal Law for Louisiana*, Introd. Pref. p. 318. Philad. 1833). The establishment of a system of poor-laws, mischievous as its mal-administration has been, has, without doubt, greatly contributed to secure the general tranquillity of this country. The northern rebels in the reign of Henry VIII., who styled themselves "the Pilgrimage of Grace," told the Duke of Norfolk that "Poverty was their captain, the which, with his cousin Necessity, had brought them to that doing."

The object of every good system of poor-laws is that stated by the Presbyterian Reformers of Scotland, in their *First Book of Discipline*. "We are no patrons," they say "to sturdy and idle beggars, who, running from place to place, make a craft of begging, for these we think must be compelled to work, or else be punished by the civil magistrates; but the poor widows, the fatherless, the impotent maimed persons, the aged, and every one that may not work, or such persons as are accidentally fallen into decay, ought to be provided for" (Spotswood, *Hist. Ch. Scotl.* book iii. p. 158. Lond. 1677).

* See Greening's *Leading Statutes*, p. 63. Burnet tells a singular story respecting the manner in which the 31 Car. II. was passed. According to his account, the Lords would have rejected the bill, but Lord Grey, who was one of the tellers, relying on the inattention of Lord Norris, who was associated with him in his duties, counted one fat Lord for ten, and thus was the majority obtained (Burnet, 321). The measure was greatly opposed in the Lords.

Law.

are held, there are certain cases in which the supreme power, exercising its extreme authority, and preferring the general good to that of an individual, disregards private rights, in consulting the public advantage. Thus, it levies taxes, compelling the citizen, out of his personal possessions, to contribute to the necessities of the state; and thus it will carry a public road through the private property of individuals, contrary to their wishes. This it can do, because it is the supreme power, and knows no limit to its authority. "By the common law, every man may come upon my land for the defence of the realm. And in such case, upon such extremity, they may dig for gravel for the making of bulwarks, for this is for the public, and every one hath benefit by it. And in such case the rule is true, *Princeps et respublica ex justa causa possunt rem meam auferre*" (12 Rep. 13).

political
rights.

The fran-
chise.

Having enumerated the principal rights resulting from the law of England, we have now to ascertain in what way their enjoyment is ensured. This security of enjoyment is consistent only with, first, the permanence of the laws from which the rights result, and, secondly, the establishment and due enforcement of adequate sanctions.

As to the permanence of the laws, it may be observed, that the right to constitute and abrogate what laws it pleases, is involved in the very idea of sovereign power (Boullenois, *Traité de la Pers. &c. des Lois*, i. 2-4); and it is therefore competent to the sovereign power, at its discretion, and without regard to the interests of its subjects, by abrogating laws, to deprive them of any right they may possess. Still, it is presumed, that it will not, from mere wantonness, so prejudice its subjects; and that, if ever it deprives them of the rights it has conferred, it does so either for their advantage or through its own ignorance and inadvertence. Such is the reverent supposition of English law. It therefore assures to the subject certain powers of instructing the sovereign power in respect of the operation and consequences of its acts, and even of remonstrating with it on the subject of its conduct. By law, also, the subject has, under certain restrictions and to a certain extent, the right of nominating the body by whom sovereign power is exercised. The rights to which we refer may, from their public character, be designated *political rights*, and their exercise yields powerful protection to those fundamental rights we have already discussed.

(1.) Of political rights, we may rank as the most important, the right of designating the persons who constitute the Commons House of Parliament—a member of that honourable body possessing the supreme power in our state.* A right, in the exercise of which

* The possession of this right by a large number of the people has given birth to the absurd notion of the *sovereignty of the people*. The absurdity of the phrase will be abundantly manifest when we consider, first, that the right of election is possessed, not by the whole, but only by a portion of the people; secondly, that the House of Commons does not exclusively exercise sovereign power, but only shares in its exercise; thirdly, that there is a wide distinction between a right to do a thing, and a right to specify by whom the thing shall be done. The Earl of Warwick, as it has been well remarked, was called *king-maker*; was he therefore to be called *king*? The disposition of property through powers of appointment, to be exercised by those who never enjoyed the property, is a familiar illustration of the position. In jurisprudence, the maxim, *nemo dat quod non habet*, must be taken with some qualification.

In the United States of America the matter is far otherwise. There, "the people is the *only* source of power." * * * The body

the community is so largely interested, and in itself so readily made subservient to the evil purposes of self-seeking politicians, should be confided to none but trustworthy hands.* But the capacity of fitly exercising this important right does not manifest itself so palpably as to render our arrangements in this matter as perfect as could be wished. All that can be done is to confine the right, as far as may be, to those whose property and age may be presumed to exempt them from the temptations of extreme poverty and the indiscretion and inexperience of youth. This, according to the *actual* theory of the constitution, is the chief motive of the restrictions on the suffrage. There are other motives, which have reference to considerations foreign to our subject. The principal motive is that which we have stated. It must not, however, be supposed that such a motive is in accordance with the *historical* theory of the constitution, which has relation to the past and its opinions—a past, ignorant of natural rights, or indifferent to their assertion, and which, in limiting the franchise to the wealthy, limited it to the class whose interests it was alone accustomed to respect. A freehold estate of 40s. a-year was, in the reign of Henry V., when the freehold qualification was established, a considerable property.

(2.) The right of petitioning the king and the parliament is also a valuable privilege of Englishmen, as enabling them to make known their grievances to those capable of redressing them. The right of the subject to petition the king is *asserted* in the Bill of Rights, which further declares illegal all commitments and prosecutions for such petitioning (1 Wm. & Mary, stat. 2, c. 2). Whether this provision repealed the Act 13 Car. II. st. 1, c. 5, against tumultuous petitioning, and which threw great impediments in the way of petitioners, is doubtful (Rex v. Lord George Gordon, Douglas, 572; and Speech of Mr. Dunning, in the House of Commons, *Ann. Reg.* for 1781, part. ii. pp. 143-4). The Act has, however, fallen into desuetude.

(3.) The right of the subjects to have arms for their defence, suitable to their condition, and as allowed by law, is also asserted by the Bill of Rights, in which,

of electors, *after* having designated its magistrates, direct them in everything that exceeds the simplest ordinary business of the state" (De Tocqueville, *On Democracy*, by Reeve, vol. i. p. 75). Similar is the description of the German democracy by Tacitus (*De Mor. Germ.* xi). The nation was formed by the union of freemen, from whom all power and every legislative enactment proceeded (Savigny, *Geschichte des Römischen Rechts im Mittelalter*, b. 1. kap. iv. s. 157. Heidelb. 1815; see also Eichorn, *Deutsche Staats und Rechtsgeschichte*, b. 1, s. 50. Gött. 1821)—the people actually exercising the functions of government, and not simply designating those by whom they should be exercised. When the representative system was introduced among the Germans, and the Scabini or Echevins became the judges (Savigny, *ut sup. cit.*) and delegates of the people (Palgrave, *R. and P. Eng. Comm.* i. 89), unless, indeed, which was certainly the case for a time, the people retained their authority in more important matters, or, like the American demos, continued in such matters to *direct* the magistrate in the performance of his office, the sovereignty of the people vanished from the constitution of Teutonic polity.

* There is a singular exposition of the duties of a popular representative contained in a curious alliterative poem on the deposition of Richard II., edited by Mr. Wright, for the Camden Society (p. 28), 1838. The popular party in the 21st Richard II. are supposed to argue after this fashion: "We be servants and take salary, and [are] sent from the shires to show what them grieveth, and to parle [speak] for their profit and pass no further, and to grant of their gold to the great wattis [the meaning of which I do not know] by no manner [of] wrong way, but if war were." I have translated the passage.

Law.

Sove-
reignty of

ing.

Right to
arms.

Law. however, it is limited to the case of Protestants—a limitation now practically abolished. In such a state of advanced civilization as that in which our lot is cast, where the authority of the laws is so effectually established, and, by an improved police, so speedily enforced, such a provision as this has but little value. But it was otherwise of old; and its preservation in our statute-book is worth something, as a record of that love of liberty, and resolute assertion of lawful rights, which has given so much vigour and dignity to our national character—itself the source of our national greatness.

*Sic fortis Etruria crevit,
Scilicet et rerum facta est pulcherrima Roma.**

Enforce-
ment of
sanctions. It is, however, in the enforcement of proper sanctions that the chief security of our legal rights consists. This is accomplished either by the act of the parties possessing such rights, or by operation of the law itself.

By act of
parties. If, in developing the *rationale* of our jurisprudence, we were permitted to indulge our imagination, we should probably represent the defence of an invaded right as devolving on its possessor in the first instance, and consider the interference of the law as occurring only when this possessor was incompetent to the attempted defence. But the *facts* of our law point to principles of a precisely opposite character. Redress by the individual is permitted only when the law is defective: *when the law fails, then the individual acts*. The law (if we may so idealize sensible agencies) is tardy in its operations—scrupulous—deliberative—fearful lest its precipitation should defeat its own pur-

* It would be improper to dismiss this subject without exposing the absurd opinion that the constitution justifies a resistance to government under certain circumstances. Such a justification is wholly alien to the very nature of government, which is founded on the notion of obedience to authority. To speak of a sovereign power as legally responsible to any body or person—as being legally subject to duties, the infraction of which involves a forfeiture of its authority, is plainly absurd; for whatever is responsible must be responsible to some one, who must, therefore, be superior, and, *pro tanto*, sovereign. Again, legal duties imply legal means of enforcing them; and how shall we style that which is subject to anybody, or any one, a sovereign? "The governor," says Archbishop Whately, "is bound to make a good use of his power, no less than his subjects are to obey him; and he is accountable to God for so doing—but not to them; for if this merely conditional right to obedience be once admitted, it must destroy all government whatever" (*Bampton Lectures for 1822*, p. 292). The philosophical historian states the case forcibly: *Si, ubi jubeantur quærere singulis liceat, pereunte obsequio, imperium etiam intercidit* (Tacitus, *Ann.* lib. i. c. 83). The morality of resisting a government is a question of *policy*, and not of *law*; and on such a ground is it put by one who had some practical experience in the matter. Alluding to this nice question of resistance, Ludlow observes, that "we ought to be very careful and circumspect in that particular, and at least be assured of very probable grounds to believe the power under which we engage to be sufficiently able to protect us in our undertaking; otherwise I should account myself not only guilty of my own blood, but also, in some measure, of the ruin and destruction of all those that I should induce to engage with me, though the cause were never so just" (*Memoirs*, p. 235). The prudence of attempts against the authority of a government appears to have been, in Bishop Burnet's estimation, one element necessary to their morality (*Hist. own Times*, p. 404). On this subject Mr. Fox has made some sensible remarks (*Life of James II.* pp. 175-6). "The true interest of this kingdom," says Lord Clarendon's editor, "is supported *non tam famâ quam sua vi*; its own weight still keeps it steady against all the storms that can be brought to beat upon it, either from the ignorance of strangers to our constitution, or the violence of any that project to themselves wild notions of appealing to the people out of parliament, as it were to a fourth estate of the realm" (Preface to *Hist. Great Rebell.* vol. i. p. xiii. Oxford, 1807).

poses—*cunctando restituit rem*. But if the law suffered redress to be sought nowhere but at the feet of its tribunals, grievous wrongs, not to be compensated, might be perpetrated with impunity. In certain cases, therefore, it is permitted to the individual to do that justice to himself which the law cannot do for him; in short, borrowing an expression from vulgar speech, to take the law into his own hands.*

In defence of his life, limbs, or property, the individual may repel force by force, being careful to act on the defensive, and to use no violence not necessary for the purposes of defence. The defence of such as stand in the relations of husband and wife, parent and child, master and servant, are equally licensed by law, subject to similar restriction (Gregory and another *v.* Hill, 7 *T. R.* 299; Barfoot *v.* Reynolds, Str. 953).

It is not, however, by an attack on his person alone, that a man's life or health may be endangered; and, with respect to that large class of personal injuries, embraced by the comprehensive term "nuisance," the law empowers the sufferer to right himself without having recourse to legal remedies. But the term "nuisance" imports a great deal more than injuries threatening the *lives* of individuals; it is significant also of many things which damage individuals in person or property, or diminish their comforts. In all these cases, without awaiting the dilatory process of legal vengeance, it is competent to the sufferer himself to *abate* (*abattre*, to pull down,) the nuisance; and "the reason why the law allows this private and summary method of doing one's self justice, is because injuries of this kind, which obstruct or annoy such things as are of daily convenience and use, require an immediate remedy, and cannot wait for the slow progress of the ordinary forms of justice" (3 *Comm.* 5). It is also competent to every person deprived by another of goods or chattels, or of his wife, child or servant, to claim and retake them, wherever he happens to find them, "since it may frequently happen that the owner may have this only opportunity of doing himself justice: his goods may be afterwards conveyed away or destroyed," &c. (3 *Comm.* 4.) A similar remedy is possessed by parties of whose lands and tenements another party has taken possession. The power of distress for the non-payment of rent or otherwise, which is sufficiently explained in another part of this work, is another species of redress exercised by the individual.

As a principle, however, invasions of rights established are properly cognizable and to be redressed by law. In short, "every subject, for injury done to him, *in bonis, in terris, vel personâ*, by any other subject, be he ecclesiastical or temporal, free or bond, man or woman, old or young, or be he outlawed, excommunicated, or any other, without exception, may take his remedy, and have justice and right for the injury done to him, freely without sale, fully without any denial, and speedily without delay" (2 *Inst.* 55-6).

We have now to consider how the law deals with invasions of the rights to which it has given birth. It treats these invasions as divisible into two classes; one

* The ancient law was founded on a different principle (Palgrave, *R. and P. Eng. Comm.* p. 225, *et seq.*; Glanville, lib. ix. c. 8; Robertson's *Charles V.*, *View*, note xx. vol. i. p. 249. Lond. 1827). Still in criminal matters the Anglo-Saxon polity recognised the principles in my text, for it was a general rule that no one could take vengeance into his own hands, until he had demanded justice in vain (*In. 9*; *Anc. Laws and Instit. of England*, p. 47, folio; see also *Ælf.* 42; *ib.* p. 40; and some observations of Mr. Allen, *Rise and Growth of Royal Prerog.* p. 118, *et seq.*).

class comprehending those which it considers to be injuries affecting the state; the other class includes what it considers to be injuries affecting individuals only. The first class we would call *crimes*; the second, simply *wrongs*. In dealing with *crimes* the law *punishes* the offender, its sole motive being the repression of crimes. In dealing with *wrongs*, the law compels the offender to redintegrate the party injured, its motive being chiefly the satisfaction of the sufferer. To enforce moral justice is its aim in the latter case; in the former, to protect the community—*ne quid respublica detrimenti capiat*. Offences may belong to both classes; the distinction in point of fact, though not in theory of law, relates less to the actual nature of the act done, than to the sanction attaching on its performance. Thus, if one meet another in the street, and beat him, this is a breach of the public peace, and a crime—an offence against the state itself. It is therefore *punishable* by fine and imprisonment. But the offender also does a wrong to an individual, who shall have his action of trespass against him, and shall recover *satisfaction* for his injury in the shape of damages.

When a crime is committed, the law will reach it if it can, and punish the criminal. An injury to the state cannot be compensated; it is itself a crime to check the progress of public justice by compounding a felony or an information under a penal statute. Not so with a wrong: here it is permitted for him injured to arrange with his injurer the terms of a satisfaction of the injury done, and this arrangement will be enforced by law. The arrangement may be of two kinds: (1) the party injured may agree to accept a certain sum or other thing as a compensation—an arrangement technically styled *accord and satisfaction*; or, (2) the parties may agree to refer their dispute to an *arbitrator*, by whom, sitting as a domestic forum, the questions of injury and compensation may be determined. We have now to consider the enforcement of legal sanctions by the operation of the law itself, that is by its administration.

(II.) The administration of the law may be exercised judicially or ministerially. The judicial administration of the law is the appropriate duty of the judicatory, or that body or person whom the supreme power has clothed with judicial authority. This judicial authority extends to the determination of all controversies which have for their subject an alleged infraction of legal rights. To decide whether this infraction has taken place in the manner alleged, is the duty of the judicatory; and that this duty should arise, it is necessary that the infraction of legal rights should be controverted as a fact (Vinnius, in *Inst.* IV. xvii.). Unless it be so controverted, the judicatory have no jurisdiction.

In England there are ordinary and extraordinary judicatories. We will consider the ordinary judicatory in the first place.

A controversy may be single or complex in its character; it may involve questions of law, or questions of fact, or both. The parties may agree on the law and differ on the facts, or may agree on the facts and differ on the law, or may differ on both facts and law. Whenever the question raised is of a legal character simply, and does not require the investigation of facts, then is it to be decided by that branch of the judicatory styled, emphatically, *the judges*. Such questions as those which relate to the observance or non-observance by one or other party

of the prescribed forms of stating his complaint or defence, or to the competency of the particular tribunal whose aid has been evoked, these and the like are questions purely of law, and involving no disputed facts. So also is the question whether, assuming the facts stated by the complainant (or defendant) to be true, those facts, in the view of the law, establish his complaint (or defence) or not. Here there are no disputed facts; this a question purely of law, and therefore the judges are to try it. But when the question is of facts, wholly or partially, then have they no proper jurisdiction (Abbot of Strata Marcella's case, 9 *Rep.* 25). Such questions are referrible to another branch of the judicatory, known to us as *the jury*, who, in deciding them, may adopt either of two courses. They may, after such evidence has been adduced to them as the parties desire, subject to certain restrictions imposed by law, forming in their own minds a judgment as to the facts of the case, and determining for themselves what is the legal character of those facts, that is, what is the law applicable to them, decide generally that the complainant (or his opponent) has made out his case, and thus decide the controversy in his favour; or they may find specially the facts as proved before them, and refer to the learned judges the task of drawing from those facts the conclusion warranted by law, thus relinquishing to them the task of terminating the controversy. As the jury, however, are not presumed to be acquainted with law,* they are presided over by a

* Coke says, that "as the question between the parties is twofold, so is the trial thereof; for either it is *questio juris* (and that shall be tried by the judges upon a demurrer, special verdict, or exception, for *cuiuslibet in sua arte perito est credendum et quod quisque norit in hoc se exerceat*; and it is commonly and truly said, *ad questionem juris non respondent iuratores*), or it is *questio facti*. And the trial of the fact is in divers ways: of these a trial by twelve men is most frequent and common" (*Co. Litt.* 125 a). A very slight consideration will show that this statement is not precisely accurate; for although the jury never decide questions purely of law, yet, in returning a general verdict, they assuredly decide questions not simply of facts; they decide the facts, and they decide the law arising out of the facts—*ex facto oritur jus* (*Co. Litt.* 226). And to this purpose speaks our great master: "Where the enquest (jury) may give their verdict at large, if they will take upon them the knowledge of the law upon the matter, they may give their verdict generally." (*Litt. lib. iii. s. 368*). But formerly it was "dangerous for them so to do; for if they do mistake the law, they run into the danger of an attain; and, therefore, to find the special matter is the safest way, where the case may be doubtful" (*Co. Litt.* 228 a). Still they may, if they please, decide the law as well as the facts, and this not *incidentally*, as Mr. Hargrave contends (*Note, Co. Litt.* 155 b), but *directly*.

The true theory of the trial by jury, if the theory is to be gathered from the facts, is very different from that stated by Coke. That theory, which distinguishes so rigidly between the capacity to decide facts and the capacity to decide law, would consider the special verdict, finding facts only, as the rule, and the general verdict as an exception, in which the jury deviate from their orbit, and their eccentricity is excused by law. But this is not so, as will appear from a consideration of the Statute of Westminster II. (13 Edw. I.) cap. xxx., which permits special verdicts to be taken in certain real actions. "Also it is ordained that the justices ordained to take assizes may not *compel* the jurors to say precisely, if it be disseisin or not, should they *wish* to find the truth of the *fact*, and to seek the assistance of the justices; but if, of their own accord, they will say that it is disseisin or not, their verdict shall be taken at their peril." At first it was doubted in what cases special verdicts could be given; but it was at last held, "that in all actions, and upon all issues, the jury *might* find the special matter of fact pertinent and tending only to the issue joined, and thereupon pray the discretion of the court for the law" (2 *Inst.* 425). And, in the case in which this was decided, it was said that the law will not *compel* the jurors, who have not the knowledge in the law, to take upon them knowledge of points in the law (Downman's case, 9 *Rep.* 13):

Law.

and the

General
verdict.Special
verdict.

Law. judge, who informs them in all matters of law connected with the case; but they are at liberty to accept or reject his exposition as an element of their decision. In criminal controversies, if the person charged with the offence is, through their verdict, declared innocent thereof by the jury, he is ever quit and discharged of the accusation, nor can he be again tried upon it. If the jury find him guilty, he is said to be convicted, and must suffer the penalty which the law has annexed to the offence of which he has been convicted, unless the judgment against him be reversed, which is sometimes done on a writ of error, which is a form of proceeding by which he appeals from the inferior judicatory to a superior tribunal. Thus, if he be tried before the itinerant justices, hereafter mentioned, he may appeal to the Court of King's Bench; and if he be tried before that tribunal, he may appeal to the House of Peers, the court of last resort. These courts can reverse the judgment, if there have been any notorious defect *in regard of law* in the proceedings. A royal pardon will also relieve him from his punishment, or the crown may mitigate his sentence. In civil controversies, the decision of the judicatory is subject to reviewal by these

Writ of error.

so that, in fact, the liberty of finding a special verdict was given "for the relief of the jurors, who, upon their oath, shall not be compelled to find, at their peril, things doubtful to them in law" (*Ibid.*); an error in their verdict subjecting them to attain. This method of punishing jurors has fallen into desuetude, and, perhaps, in many cases, never pretended to be a remedy (per Lord Mansfield, *Bright v. Eynon*, 1 Burr. 390). It was, however, frequently resorted to in ancient times; and the granting, by the king's courts, of a writ of attain against a jury, for giving a verdict contrary to their oaths, is commanded by the Statute of Westminster I. (3 Edw. I.) cap. xxxviii. Sir Thomas Smith ascribes the disuse of attain to the difficulty of obtaining a conviction (*De Rep. Ang. lib. iii. cap. 2*; and see Hudson's *Treatise on the Star Chamber*, I. s. 4.). It must be recollected after all, and in forms we see preserved the original theory, from which modern practice often deviates, that when the jury do confine themselves to finding facts, and leave the points of law to the judgment of the judges, still the decision, both on law and facts, is *in form* that of the jury. The form is shortly this: in finding a special verdict, they state the naked facts as they find them to be proved, and pray the advice of the court thereon, concluding conditionally, that if, upon the whole matter, the court shall be of opinion that the plaintiff had cause of action, they then find for the plaintiff; and if otherwise, then for the defendant. Sometimes, and now most usually, the jury find generally for the plaintiff, subject to the opinion of the court upon a special case, stated by both parties or their representatives, with regard to a matter of law. Which ever way is adopted, it is a *general verdict of the jury* which terminates the controversy.

In Scotland, although the general verdicts in criminal cases were authorized by ancient practice, a custom crept in—probably in the reign of Charles II., when Sir George Mackenzie, the Lord Advocate (*Law and Cust. of Scotland in Crim. Matters*, tit. xxiii., *Works*, vol. ii. p. 242; 1722), contended for the abolition of juries—to consider the jury as triers of facts only; nor was this notion expelled the judicature until (1728) the trial of Carnegie for the murder of the Earl of Strathmore. In this case the judges found the facts in the indictment "relevant to infer the pains of law," and as the facts of the indictment were clear, the life of the prisoner would have been sacrificed, had not the jury, at the instance of the prisoner's counsel, Mr. Dundas, afterwards Lord Arniston, and Lord President of the Court of Session, asserted their right of returning a general verdict, and acquitted him (Lord Woodhouselee's *Life of Lord Kames*, vol. i. p. 35). Upon this subject consult Foster, *Cr. Law*, 279-80. On the other hand it may be observed, that, if it cannot with propriety be stated that the jury are judges only of facts, their decisions appear in very early times to have been subject to judicial revision. *Sed cum ad judicem pertineat justum proferre judicium, oportebit eum diligenter examinare si dicta juratorum in se veritatem contineant, et si eorum justum sit judicium vel fatuum; ne contingat judicem eorum dicta sequi et eorum judicium, ita falsum faciat judicium et fatuum* (Bracton, lib. iv. cap. 19).

VOL. II.

high tribunals in way of appeal, who in this case also do not disturb the judgment of the inferior judicatory, as far as that judgment was a decision on facts; they take cognizance only of matters of law.

Law.

In civil controversies tried by juries, it is competent, under certain restrictions, to the unsuccessful party to apply to the full court at Westminster for a *new trial*; but he will not succeed in his application unless he can satisfy the court either that the judge below misdirected the jury in some matter of law, or that the discretion of the jury has not been properly or legally exercised; "for it is a great principle of law that the decision of a jury upon an issue of fact is in general irreversible and conclusive" (Stephens, *Pleading*, 105, 4th edit.). There are other means by which verdicts may be avoided, not necessary to be mentioned here.

As to the form in which civil controversies are submitted to the judicatories, it may be stated, that the litigants exchange statements until one asserts that his adversary's statement is not in the form prescribed by law, or does not, even if true, sustain his complaint (or defence), or that the facts alleged by the adversary are not true. An allegation of one of these kinds having been denied by the adversary, a question—stated, in truth, by the litigants themselves—arises for the determination of the judicatory.

In criminal cases, generally, the proceeding is different. Crimes being committed against the state, it is the state, in the name of the king, who proceeds for the punishment of the offender. The complaint or charge is made by the proper officer, and exhibited, in the first instance, to a jury,* called, from the eminence of their functions, the *grand jury*, who, sitting by themselves, adopt it (in which case twelve of their number must concur), or reject it. If they adopt it, it is preferred before the ordinary tribunal, consisting of a judge or judges and a jury, and this charge, if denied by the culprit, is the matter they have to decide.

We will now consider the constitution of the judicatory more particularly.

The jury are certain persons indifferently selected by a proper officer, being properly qualified, in point of property and age, for the discharge of their duties. No controversy diminishing the personal security, liberty, or property of the subject† can be disposed of without the concurrence of a jury. The manner in which they exercise their functions will be hereafter explained.

The judges are of two kinds; those who are presumed to derive their authority from the king, in fiction of law the supreme judge, and those whose jurisdiction is the result of the common or traditional law or of acts of parliament.

(1.) The king is, in theory of law, presumed to be the King's judges.

* We may also observe, in allusion to what is said in reference to the grand jury, that their interference is sometimes dispensed with, in such cases of misdemeanor affecting the king's crown and dignity as the king's attorney-general thinks fit. He is justified, at his pleasure, of becoming himself the party charging and filing his information *ex officio*, which the common jury, in the ordinary form, have then to try. And in minor offences, informations may be filed on the application of private parties, permission having been previously obtained from the Court of King's Bench.

† This must be understood with the important exception of controversies relating to property entertained by Chancery, and with the other exceptions, scarcely deserving notice, of those cases within the summary jurisdiction of magistrates.

5 K

Law.

supreme judge of the state (Bracton, lib. iii. cap. 9-10), and to be present at one and the same time in all his courts of justice in all parts of the realm. But this is true only in theory of law,* for he "hath committed his power judicial, some to one court and some to another; so as if any would render himself to the judgment of the king in such cases where the king hath committed all his power judicial to others, such render would be of no effect" (3 Inst. 71). *Proprio ore, rex nullus Angliæ judicium proferre usus est* (Fortescue, *De Laud. Leg. Ang.* cap. viii.); and neither the king himself nor his privy council (see p. 809) can question, determine, or dispose of the property, real or personal, of any subject, nor adjudge any criminal case (12 Rep. 64); but all matters of such a kind are to be tried in the ordinary courts of justice, and the ordinary course of law (*Magna Charta*, cap. 29; 16 Car. I. cap. 10). The judges—*consules non unius anni*—are considered as the depositories of the fundamental laws of the realm, and have gained a known and certain jurisdiction, which can be increased, diminished, or amoved by no authority less than that of Parliament (2 Hawk. P. C. 2).

The superior courts of common law.

There are the three superior courts of common law, in each of which sit the king's judges: the Court of King's (or Queen's) Bench, the Court of Common Pleas, and the Court of Exchequer. Each of these courts consists of five judges, those of the latter being styled Barons; and one in each court presiding, those in the two first-named being styled Chief Justices, and that in the latter Chief Baron.

The original distribution of business amongst these courts was as follows: the cognizance of crime and of such matters of controversy as directly concern the king, his rights, dignity, and functions (with the exception of matters relating to his revenue), belonged to

* Anciently the king used personally to decide causes in the aula regis (*Dial. de Scacc.* lib. i. s. 4); and Edward I. frequently sat in the Court of King's Bench (4 Burr. 851), an example in which he was imitated by the celebrated Alice Perrers, or Pierce, the mistress of his redoubtable grandson Edward III. (Barrington, *Observations on 36 Edward III.*; but see Henry, *Hist. G. B.* vol. v. p. 382.) Edward IV. went one circuit with his judges, to try some heinous offenders (*Hist. Croyl. Cont.* 1 Gale, *Script.* 559); but he had previously (in the second year of his reign) sat three days together in the King's Bench, in order to understand the law (Stowe, *Chron.* p. 416. London, 1631). According to his own account, James I. was anxious to acquire this knowledge (*Rym. Fæd.* vii. 19). Municipal jurisprudence appeared to have peculiar charms in his eyes, for we are told that when he was in Denmark, for the purpose of marrying a Danish princess, he spent less time in the society of his destined consort than in the courts of justice. "Happy they," says Fuller, "who have no other business there!" After his accession to the English crown, he was desirous of exercising judicial power in his own person. In this he was opposed by the judges. "A controversy of land was heard by the king, and sentence given, which was repealed for this, that it did belong to the common law." The king, in allusion to this circumstance, observed, that "he thought the law was founded upon reason, and that he and others had reason as well as the judges." To which Coke replied, that "true it was that God had endowed his Majesty with excellent science, and great endowments of nature, but his Majesty was not learned in the laws of his realm of England; and causes which concern the life or inheritance or goods or fortune of his subjects are not to be decided by natural reason, but by the artificial reason and judgment of law, which law is an art which requires long study and experience before that a man can attain to the cognizance of it, and that the law was the golden metwand and measure to try the causes of the subjects, and which protected his Majesty in safety and peace." With this the king was greatly offended, and said that "then he should be under to the law, which was treason to affirm." Coke retorted by quoting Bracton: "*Quod rex non debet esse sub homine, sed sub Deo et lege*" (12 Rep. 65).

the Court of King's Bench; civil suits between subject and subject, involving their private rights (called *communia placita*, or common pleas), to the Court of Common Pleas; and matters relating to the royal revenue, to the Court of Exchequer. By aid of fictions of law, however, the exclusive province of the Court of Common Pleas has been invaded; the Courts of King's Bench and Exchequer, in sequence of the maxim, *boni judicis est ampliare jurisdictionem*, have now extended their jurisdiction to all controversies in which the object of the parties is the recovery of goods or chattels specifically, or recompence (damages, as it is technically phrased), or other redress, for breach of contract, or any injury of a like kind. The jurisdiction of the Court of Common Pleas remains unaltered. It is, then, the appropriate duty of these courts to determine all questions of law involved in any controversy, according to the above numeration.

Anciently, all legal controversies were determined in the courts sitting usually in the king's ancient palace at Westminster;* nowhere else was a judge to be seen. Thither came all the parties; and where the case was one involving disputed points, thither also came witnesses and jury (2 Inst. 422). Now, in controversies simply legal in their character, and the determination of which requires no jury, thither still the parties must resort. And in controversies for the final determination of which, as is ultimately proved, the verdict of a jury is necessary, all questions to be disposed of prior to the consideration of the question of facts, being of course questions of law, the courts of Westminster, or one of them, are still competent to decide. But when the controversy has assumed its final shape, and the question of fact comes to be tried, then, unless they be present in the county where the trial is to occur,† the jurisdiction of these judges passes into certain of their number, and some other persons commissioned by the king twice every year, to travel through the country, to preside over the deliberations of all juries, and to decide all questions of law which may possibly arise.

The judges of the three superior courts of common law, and the three vice-chancellors, are appointed by the king: their salaries are fixed and ascertained; and neither these nor their commissions terminate or are vacated by demise of the king; but they are removable on the address of both Houses of Parliament (12 & 13 Will. & M. cap. 2; 1 Geo. III. cap. 23; 53 Geo. III. cap. 24; 5 Vict. cap. 5). So dearly is the independence of these judges tendered by the law, that they are forbidden to obey any injunction which may

* The sittings of the Common Pleas are fixed at Westminster (*Mag. Chart.* cap. xi.); but the Courts of King's Bench and Exchequer may follow the king, as the first did Edward I. to Roxburgh (3 Comm. 42), and both did to Shrewsbury (Barrington on *Mag. Chart.* cap. 11), and to York.

† Compare 4 Inst. 73, with 2 Hale, P. C. 4, and 2 Hawkins, P. C. 17. For the purpose of punishing the malversations in office committed by civil or military authorities in the colonies, it has been enacted that they may be prosecuted in the Court of King's Bench, in England, the offence to be laid as if it had been committed in Middlesex; and the court may adjudge the officer incapable of serving the king for the future. If the party proceeding institutes civil proceedings, the fact may be laid at Westminster, or in the county where the defendant may be resident (42 Geo. III. cap. 85). All offences committed on the high seas are to be tried by commissioners appointed by the king, of whom the admiral or his deputy, that is, the judge of the Admiralty Court, is always one; or they may be tried by the Central Criminal Court (28 Hen. VIII. cap. 15; 39 Geo. III. cap. 37; and 4 & 5 Will. IV. cap. 36, s. 22).

Law.

The Court of King's Bench, of Common Pleas, of Exchequer.

Sittings at Westminster.

Duties of judges; their independence.

Law. interrupt them in the discharge of their duties. They must, as the king is bound to do (*Magna Charta*, cap. xxix.), neither sell nor delay justice (*per* Lord Nottingham, Duke of Norfolk's case, 3 *Ch. Ca.* 1; *per* Willes C. J., 2 Kenyon, 478), nor stay the delivery of their judgment,* even at the king's command (*per* Coke C. J. and the other judges; *Biog. Brit.* art. Coke), nor deliver their opinion beforehand on any criminal or other case that may come before them judicially (3 *Inst.* 29).†

Local courts.

(2.) Inferior in jurisdiction to these king's judges are certain others, whose jurisdiction is local, and derived either from the traditional or common law or from act of parliament. It was the policy of the ancient law to bring justice to every man's door. Resort could not be had to the royal courts until the suitor had demanded "right at home;" and thrice was the demand to be made.‡ Most of the local tribunals have now fallen into decay, and the renowned County Court, the genuine offspring of Teutonic times,§ is confined in its jurisdiction to certain civil controversies, where the matter in issue is of a value less than twenty pounds (3 & 4 Will. IV. cap. 112). Over this court presides the sheriff, who is appointed by the king, and who is to a certain extent his officer; and all the freeholders of the county are presumed to be present.

County court.

Corporation courts.

In certain corporate towns also courts are holden, where judges, whose jurisdiction is limited, preside: the functions and authorities of these are defined by acts of parliament (5 & 6 Will. IV. cap. 76; 7 Will. IV. cap. 105; 1 Vict. cap. 78). The justices of the peace share also, to a certain extent, in the judicial power, and are empowered singly, and without intervention of a jury, to decide trifling matters, chiefly criminal—violations of the law, to which the sanction annexed is not severe in its character. Also, in their quality of conservators of the peace, they may cause the apprehension of those who have committed, or are suspected of having committed, any breach of the peace or higher offence, even although their jurisdiction does not authorize them in any further proceeding beyond remitting the charge to a superior tribunal (2 Hale, P. C. 108). These justices, besides the jurisdiction belonging to each singly, have a jurisdiction when they sit together in the Court of Quarter

Court of Quarter Sessions.

* Palgrave, *Essay on the King's Council*, p. 125.

† Coke, however, styles the judges the king's council in matters of law (*Co. Litt.* 110 a, 304 a). We may believe this, however, to be simply an allusion to the fiction that the king is judge in all his courts; for, in the famous case of commendams, Coke stoutly denied that the judges were bound to obey a command from the king to stay the hearing or decision of a cause (*Biog. Brit.* art. Coke). "To the end that the trial may be more indifferent, seeing that the safety of the prisoner consisteth in the indifferency of the court, the judges ought not to deliver their opinions beforehand of any criminal case that may come before them judicially" (3 *Inst.* 29). The same reason applies to civil cases. It was, however, a usual practice to obtain extrajudicial opinions from the judges, both in early and almost recent times. It was done in Sir John Fenwicke's case, in Francia's case (*Foster, Cr. Law*, 241), and in the reign of Geo. I., on the question whether the education and marriage of the Prince of Wales' children belonged to the king or to their father (11 *Harg. St. Tr.* 295); and it was also done in Admiral Byng's case (*Fortescue, Rep.* 385; *Harg. note Co. Litt.* 120 a). Mr. Hargrave has printed a very singular conference between the king and the judges previous to his assenting to the Petition of Right (Preface to Sir Matthew Hale's *Jurisdiction of the Lords' House*, p. xlix.).

‡ Palgrave, *Rise and Progress of the English Commonwealth*, part i. p. 283.

§ Meyer, *Esprit Inst. Jud.* t. i. p. 385, et seq. Bouquet, *Droit Pub. de France*, p. 135.

Sessions of the peace—a court competent to decide civil controversies, where the point in dispute is whether against the party complaining an injury has been committed with violence, either actual or implied (trespass, as the law phrases it), and criminal, where any one is charged with a crime amounting to what the law styles felony. Still neither this nor the corporation courts above mentioned can try cases of treason, murder, or any capital felony, nor any felony which, when committed by a person not previously convicted of a felony, is punishable by transportation for life, nor certain other heinous offences (5 & 6 Vict. cap. 38).

Law.

Allusion must also be made to the court of the Coroner—an officer chosen for life by the freeholders of the county, and whose jurisdiction extends chiefly to the inquiring into the manner of the death of any person who is slain, dies suddenly or in prison. The inquiry must be made by a jury, whom the coroner instructs in all matters of law, and generally superintends; and when they find any one guilty of homicide, he is to commit the person so found to prison.

Coroner's court.

The extraordinary judicatories are those of the Court of Chancery and the House of Lords.

Extraordinary judicatories.

The action of the Court of Chancery may be generally described as supplying the wants and correcting the rigour of the positive established law (*Lord Chan. King, Legal Jud. in Chanc.* p. 26). It administers a peculiar branch of law styled *equity*; but although its proceedings are said to be "*secundum discretionem boni viri*," yet "when it is asked, *vir bonus est quis?* the answer is, *qui consulta patrum qui leges juraque servat*,"* and, as is said in Rook's case (5 *Rep.* 99 b), that discretion is a science, not to act arbitrarily according to men's wills and private affections, so the discretion which is executed here is to be governed by the rules of law and equity, which are not to oppose, but each in its turn to be subservient to the other. This discretion in some cases follows the law implicitly; in others assists and advances the remedy; in others, again, it relieves against the abuse, or allays the rigour of it; but in no case does it contradict or overturn the grounds or principles thereof, as has been sometimes ignorantly imputed to this court:† that is a discretionary power which neither this nor any other court, not even the highest, acting in a judicial capacity, is by the constitution entrusted with"‡ (*per* Sir J. Jekyll, M. R.,

The Court of Chancery.

* "The judges of the common law" says Lord Commissioner Whitelocke, "have certain rules to guide them; a keeper of the seals has nothing but his own conscience to direct him, and that is oftentimes deceitful. The proceedings in Chancery are *secundum arbitrium boni viri*, and this *arbitrium* differeth as much in several men as their countenances differ; that which is right in one man's eyes is wrong in another's."

† The allusion is probably made to Selden. "Equity is a roguish thing. For law we have a measure—know what to trust to; equity is according to the conscience of him that is Chancellor; and as that is larger or narrower, so is equity. 'Tis all one as if they should make the standard for the measure a Chancellor's foot. What an uncertain measure would this be! One Chancellor has a long foot, another a short foot, a third an indifferent foot: 'tis the same thing with the Chancellor's conscience" (*Table Talk*, art. Equity). Lord Eldon has made indignant allusion to this diatribe against equity, (*Gee v. Pritchard*, 2 *Swanst.* 414). But see some observations of Vaughan, C. J., Sir Matthew Hale, C. B., and Sir Orlando Bridgman, L. K. (1 *Mod.* 307–9).

‡ The equitable jurisdiction of the Roman prætor was similar. The prætorian law is styled, by Marcianus, *viva vox juris civilis*; according to Irnerius, *quia voluntatem juris civilis eloquitur*; existing, in short, *adjuvandi, supplendi jus civile* (*Dig.* I. 1. 7, 1). On this

Law.

Cowper v. Earl Cowper, 2 P.W. 753). In this court presides the Lord Chancellor, or Lord Keeper,* a principal officer of state, to whom is committed the custody of the Great Seal, and who is in all law matters adviser of the crown. He is also usually a peer, and president of the House of Lords, and, from the eminence of his functions, stands next in rank to the Archbishop of Canterbury.

The defects of the common law, and of the machinery by which it is administered, are the *presumed* foundations of Chancery jurisdiction; and it is usual for the complainant seeking its aid to aver, as a matter of form, that he is remediless at common law. This is taken as justifying his application to Chancery, where is held the maxim, *nullus recedat à Cancellariâ sine remedio*. Often the averment is false, inasmuch as courts of common law may assume a jurisdiction previously entertained exclusively by courts of equity, who are not thereby deprived of their jurisdiction (Toulmin v. Price, 5 Ves. 238). Sometimes courts of equity acknowledge rights of which courts of law can take no cognizance; sometimes the former afford only a more complete and efficient remedy than the latter. For example, matters of account can be better adjusted by a court of equity than at common law; and thus the old action of account has fallen into disuse; questions of dower and tithes more easily determined; and partitions less expensively effected. The whole theory of a court of equity may be summed up in a word—it is to afford *relief*. Like every other court of justice, it declares rights only incidentally (*per* Lord Cottenham, L.C.; K. Bruce, V.C.; 11 Law J. (N.S.) Ch. 406); it acts upon the person, and not directly upon the thing, and in pursuit of its object it will restrain legal rights, undoubtedly “a dangerous jurisdiction” (Hill v. Barclay, 16 Ves. 406). It will relieve against accident, mistake, and fraud, where by so doing it serves the ends of substantial justice; never, however, deserting the straight paths of law and

subject the opinion of Lord Hardwicke is valuable: “Some general rules there ought to be, for otherwise the great inconvenience of *jus vagum et incertum* will follow; and yet the prætor must not be absolutely and invariably bound by them, as the judges are by the rules of the common law. In the construction of trusts, which are one great head of equity jurisdiction, the rules are pretty well ascertained; so they are in cases of redemption of mortgages, which makes another great branch of that business. But as to relief against frauds, no invariable rules can be established. Fraud is infinite, and were a court of equity once to lay down rules how far they would go, and no farther, in extending their relief against it, or to define strictly the species or evidence of it, the jurisdiction would be cramped, and perpetually eluded by new schemes which the fertility of man’s invention would contrive” (Letter to Lord Kames, published in the *Life* of the latter by Lord Woodhouselee, vol. i. p. 244).

* Sir F. Palgrave has shown how the equitable jurisdiction of the Chancellor arose out of that anciently exercised by the council. The nature of this latter may be learnt from a schedule containing, amongst others, the following article for the “good governance of the land.” “Item, that all billes [that shall be putt unto the counsaill] that comprehend maters terminable at the commune lawe that semeth nought fenyed, be remitted there to be determined; but if so be that ye discrecion of the counsaill feele to greet myght on that oo side and unmyght oo that othir” (*Rot. Parl.* 2 Hen. VI. vol. iv. p. 201). Various statutes delegated to the Chancellor portions of the jurisdiction exercised by the council in aid of the common law, and, in these instances, as well as when any special writs were granted, which the Chancery was empowered to grant, if none already existed, provided for the evil complained of (*Stat. Westm.* II., 13 Edw. I. cap. 24), the application was made to the Chancellor, who granted or refused the remedy. Fraud or violence, or doings against good conscience, were the substance of the proceedings in these branches of Chancery jurisdiction (Palgrave, *Essay*, p. 94).

precedent. Its relief is often more effectual than that of a court of law, especially in cases of contract, because it need not, as must the latter, when a contract has been violated, compel a recompence, by the party guilty, to the party suffering the wrong,—but it may compel the actual execution of the contract itself. It regards penalties for the payment of money in a different light to that of courts of law, who treat them as forfeited if the money is not paid when stipulated. A court of equity, on the other hand, considers them as securities only, and to be relieved against on payment, within a reasonable term, of the principal monies and lawful interest. It will relieve also, in cases “of general concern,” upon general principles of mischief to the public (*per* Lord Hardwicke, *Walmesley v. Booth*, 2 Atk. 27), as in cases of “a catching bargain against a necessitous and improvident heir” (*Barnardiston v. Lingood*, 2 Atk. 135); for “devouring an heir,” as Lord Chancellor Cowper called it, is a practice against which the court directs all its influence.

Its mode of proceeding differs from that of courts of law. It is judge of law and facts, although in some cases it may on both crave the opinion of a common law court and a jury respectively. It compels the discovery of facts by the defendant on oath, whom courts of law never examine. Its forms of procedure have been framed according to the course of the civil law in some respects, and analogous to the common law in others (*Davis v. Davis*, 2 Atk. 23). The care of lunatics and idiots, and jurisdiction in cases of bankruptcy, were until lately possessed exclusively by the Lord Chancellor; but his duties in these respects have of late been materially lightened. The Courts of Chancery jurisdiction are, (1) that in which the Chancellor presides; (2) the Court of the Master of the Rolls; and (3) those of the three Vice-Chancellors, the senior of whom at present bears the title of Vice-Chancellor of England.

Such is a brief sketch of a court of equity whose origin is so ably described by one of its most distinguished judges:—

“New discoveries and inventions in commerce,” says Lord Hardwicke, “have given birth to a new species of contracts, and these have been followed by new contrivances to break and elude them, for which the ancient simplicity of the common law had adapted no remedies; and from this cause courts of equity, which admit of a greater latitude, have, under the head *adjuvandi vel supplendi juris civilis*, been obliged to accommodate the wants of mankind. Another source of the increase of business in the courts of equity has been the multiplication and extension of trusts. New methods of settling and incumbering landed property have been suggested by the necessities, extravagance, or real occasions of mankind. But what is more than this, new species of property have been introduced, particularly by the establishment of the public funds, and various transferable stocks, that required to be modified and settled to answer the exigencies of families, to which the rules and methods of conveyancing would not ply or bend. Here the liberality of courts of equity has been forced to step in and lend her hand.”*

The House of Lords is the supreme appellate jurisdiction in the kingdom, and is the court of final resort for all cases which courts of law and equity have en-

Law.

* Letter to Lord Kames, *Memoirs*, vol. i. p. 247.

Law. tertained. In cases also of high treason and felony committed by peers, peeresses by birth or marriage, and queens dowager or consort, it has original and exclusive jurisdiction as a criminal court, provided that it is in session; and if not, its authority in this respect is exercised by certain of its members, specially summoned for the purpose, called, from its president, the Lord High Steward's Court.

Ministerial administration of the law. Having considered the judicial administration of justice, we have now to consider that which may properly be denominated the ministerial. And here we may notice, that, treating of the jurisdiction of the judges, publicists have often regarded that jurisdiction as susceptible of a twofold division—the contentious and the voluntary jurisdiction. In their sense, the jurisdiction of the Court of Chancery in its capacity, anciently important, of *officina brevium*, or workshop of original writs, would be styled its *voluntary* jurisdiction, these writs being due *ex officio et debito justitiæ*, and the Chancellor having no authority to deny them. So also the jurisdiction of the Consistory and Prerogative Courts, in granting probate of wills and administrations of the effects of intestates, is styled *voluntary*; although, seeing that such granting may be disputed, and become the subject of *contentious* jurisdiction, the phrase cannot well be justified. What is called the *voluntary* jurisdiction of judges, is, in point of fact, no more than certain *ministerial* duties executed by them in addition to their judicial duties.

Contentious and voluntary jurisdictions.

Uncontroverted claims and charges.

It has been already observed that the judicial power is conversant only with *controversies*.* If the charge or complaint of the prosecutor or plaintiff be not denied, it is taken as proved; and the judicatory or their officers, exercising no discretion in the case, simply proclaim and direct the execution of the penalty which the law annexes to proved offences of the kind. Here their duties are purely ministerial; and thus no power otherwise than ministerial is evoked when a right has been invaded, and, the fact of its invasion having been properly charged, has not been denied. The inferior ministerial officers of the law which require notice, are—

The sheriff.

(1.) The sheriff, who is bound personally or by his officers to execute the process and obey the commands of the king's courts, and

The constable.

(2.) The constable, whose duty it is to preserve the peace, and who is for that purpose armed with very large powers, of arresting or imprisoning, of breaking open houses, &c., in exercise of which powers he is amenable to the law which has confided them to him. The justices of the peace, and other functionaries, have also their ministerial duties.

273. II. DEFENCE.—The defence of the realm is entrusted by the law to the care of the king, to whom, for that purpose, is confided the government and command of the militia within the realm, and of all forces by sea and land, and of all forts and places of strength (13 Car. II. cap. 6). The law, to enable him to exercise these high functions with efficiency, vests in him the authority of appointing all ports and havens, of

causing the erection of beacons, lighthouses, and sea-marks (these latter privileges being now exercised through the medium of the Corporation of the Trinity House, 8 Eliz. cap. 13), and of prohibiting the exportation of arms or ammunition.

The military force, which exists for the defence of the country, is of three kinds—

(1.) The *Militia*, a citizen soldiery, consisting of a certain number, fixed by the Privy Council every ten years, of the inhabitants of every county, chosen by ballot. They must serve for five years, either in person or by approved substitutes. The officering the militia is intrusted to the lord lieutenants, but the officers must have certain qualifications of property, according to their ranks; the actual enrolment and organization of the regiment is the task of the deputy lieutenants. In ordinary times, the period during which they may be placed on duty is limited to twenty-eight days in every year (55 Geo. III. cap. 65), and the king may suspend their embodiment during any year he pleases (57 Geo. III. cap. 51). In the cases of invasion, or imminent danger thereof, of rebellion and insurrection, the crown can call out the militia, increasing, if it pleases, the quota fixed by the Privy Council for any county, and place them under military command. They need serve only in Great Britain and Ireland, and in the latter country for not more than two successive years. In addition to this, the regular militia, there is the local militia, inferior in its numbers, but more limited in service, and the yeomanry, who are mounted Yeomanry volunteers.

(2.) The Army, a standing military force, unknown to the early days of our constitution, and denounced by the highest authorities in constitutional law as menacing the subversion of our liberties. The jealousy of our legislature, itself once the unwilling servant of military power, has removed the probability of such perils for the future; whilst the fact, that, in these latter days, England has become a great continental power, and possessed of a vast transmarine empire, extending through both hemispheres, sufficiently demonstrates the necessity of an organized and disciplined force, capable of easy transport to any point where danger is anticipated.*

The raising or keeping a standing army within the kingdom in time of peace, unless it be by consent of Parliament, is against law (1 Will. & Mary, st. 2, cap. 2). It has been declared contrary to the laws and franchise of the land for the crown to issue commissions for the punishment of soldiers, mariners, or others, for any crime whatsoever (3 Car. I. cap. 1). It is, then, by permission of Parliament, annually granted, that our standing army is maintained; and it is governed under the authority of an annual Act, "to punish mutiny and desertion, and for the better payment of the army and their quarters."

(3.) The Navy, to whom we owe the vast extent of our dominion, and the exemption so long enjoyed by our country from the miseries of an invasion. The right possessed by the crown, of impressment, or of compelling seafaring men to enter the service of the

* It may, however, be remarked, that sometimes the controversy which calls the judicial power into operation, is a controversy only in name and shape. Of the suits entertained by the Court of Chancery, a large proportion have no other purpose than to transfer the management and administration of property from individuals to the court itself; but although not in reality *contentious*, they are so in appearance and pretence. See Coke's observations respecting the Court of Requests, 4. Inst. 97-8.

* The object of a standing army is thus recited in the annual Mutiny Act: "Whereas it is adjudged necessary by Her Majesty and this present Parliament, that a body of forces should be continued for the safety of the United Kingdom, the defence of the possessions of her Majesty's crown, and the preservation of the balance of power in Europe (5 & 6 Vict. cap. 12).

Law.

navy, is considered as part of the common law (Foster, *Cr. Law*, 154); but though the king can thus claim the service of all his subjects, he is bound to remunerate them (Foster, *Cr. Law*, 160-1). The navy is governed under the authority of an annual Mutiny Act.

economy.

274. III. SOCIAL ECONOMY.—Laws which directly consult the health, wealth, convenience or comfort of the public, may properly be referred to this head: and here it may be proper to observe, that the genius of English law differs from that which obtains generally on the Continent, inasmuch as a great deal of what is there ordinarily undertaken by the government, is here relinquished to private enterprise and discretion. In one material point, however, our social legislation possesses a decided advantage over that of the greater part of continental Europe—in respect of the laws which relate to the relief and support of the poor. Although public opinion has been, and still is, much divided as to the policy or impolicy of the late alteration in those laws, this at least is plain, that they stand in advantageous contrast to those of every other state.

History of
the poor
laws.27 Hen.
VIII. cap.
25.

It will be desirable to state briefly the history of legislation with reference to this subject. The early statutes seem to have had no other purpose than to prevent vagrancy; and, in an age of defective police, wandering labourers and "valiant beggars" were objects of terror in the distant village and to the lone husbandman. These Acts regulate begging. In the 27th Henry VIII. cap. 25, we see the first germ of a poor law. It does not authorize, however, the compulsory levy of money for the relief of the poor; but simply commits the charge of the poor to certain officers, who are to expend for their benefit the sums raised by voluntary contribution: the statute further prohibits private alms-giving. Upon the sturdy beggar it inflicts the punishment of whipping for the first offence; cropping of the right ear for the second; and, on a third offence, requires him to be sent to the next gaol till the Quarter Sessions, to be there indicted for wandering, loitering, and idleness; and if convicted, he was to suffer death, as a felon and an enemy of the commonwealth.

1 Edw. VI.
cap. 3.

These "goodly statutes, partly by foolish pity and mercy of them which should have seen the same executed, and partly from the perverse nature and long-accustomed idleness of the persons given to loitering," seem to "have had small effect;" idle and vagabond persons being unprofitable members, or rather enemies of the commonwealth, were suffered to remain and increase. The 1 Edw. VI. cap. 3, which thus recites the evils consequent on the state of vagrancy, provides that an able-bodied man not applying himself to honest labour, nor offering to serve for meat and drink, if he could obtain nothing more, should be taken for a vagabond, branded on the shoulder, and adjudged a slave for two years to any person who shall demand him, to be fed on bread and water and refuse meat; if he run away within that period, he was to be branded on the cheek with the letter S, and adjudged a slave for life. There are many other provisions equally stringent.

Inefficacy
of early
legislation,

The experience of the early acts of parliament made in relation to the relief of the poor, affords a useful lesson on the fruitlessness of ill-advised legislation: all these acts of parliament, all the gentle askings of the collectors, all the exhortations of the ministers, and the charitable ways and means of the

bishop, appear to have been ineffectual in persuading the parishioners to intrust to the collectors the distribution of their alms: and as to the provisions against the vagrants, their inefficiency is shown by the recital of the 14 Eliz. cap. 5, which states, that "all the parts of this realm of England and Wales be presently with rogues, vagabonds and sturdy beggars exceedingly pestered; by means whereof daily happeneth in the same realm horrible murders, thefts, and other great outrages, to the high displeasure of Almighty God, and to the great annoyance of the commonwealth." At length was passed the celebrated 43 Eliz. cap. 2, 43 Eliz. cap. 2; which creates the well-known office of overseer, and commits to it the duty of levying and administering a rate for the benefit of the poor. This rate was to be applied in setting to work and apprenticing the children in each parish, whose parents appeared to the proper officers unable to maintain them; in setting to work all persons having no means of subsistence, or using no trades; and for the necessary relief of such of the poor as were unable to work from age or infirmity.

Law.

The misdirected humanity of subsequent legislatures led them to infringe the principle of this beneficent law; and through a variety of causes, unworthy of specific detail, its wholesome provisions became neglected in practice, and abuses connected with the administration arose, which threatened to destroy at once the value of our property and the character of our labourers. An Act has been lately passed which professes to avert evils so dreadful in their consequences. By this Act (5 Wm. IV. cap. 76) the superintendence of the administration of the relief of the poor is intrusted temporarily to three commissioners, appointed by the crown. They are authorized and required to make all rules, orders and regulations for the management of the poor, for the government of workhouses, for the education of the children therein, and for the management of parish poor children and the supervision and regulation of the houses wherein they are kept, for the apprenticing the children of poor persons, and for the guidance of all officers connected with the management of the relief of the poor, and generally for all matters relating to expenditure in the relief of the poor. A power is reserved to the king in council to disallow the orders of the commissioners, which must be laid before Parliament, and before they have any operation must be submitted to a secretary of state; nor can any general order be rescinded or suspended without permission of such secretary, (5 & 6 Vict. cap. 58, s. 3). The commissioners, however, cannot interfere directly in ordering relief to be given to any individual; indeed, the actual administration of relief is still intrusted to local officers. In exercise of the authority for that purpose given them by the Act, the commissioners have formed unions of parishes, for the more economical and impartial administration of relief; each parish, however, being separately taxed for the relief of its own poor. Each union is governed, subject to the superintendence of the commissioners, by its board of guardians, consisting of persons possessing a certain amount of property, chosen by the rate-payers and landowners of the parishes forming the union, to whom are added certain *ex-officio* members, being the resident justices of the peace. The actual dispensers of relief are paid servants of the board, by whom they are chosen, subject to the approbation of the commissioners.

sioners,

Unions.

Law. Principles and object of the Poor Law Amendment Act.	The Poor Law Amendment Act was passed, not for the purpose of abolishing the necessary relief to the indigent, but for preventing various illegal and dangerous practices which had by degrees grown up in the administration of such relief (<i>First Ann. Rep. App. A. No. 4</i>). By law, the guardians can only give relief to the able-bodied needy in the workhouse, or in some cases out of the workhouse, by setting them to work. It is an essential condition, that when the wants of any destitute able-bodied person are supplied by relief given in return for work, the work or mode of relief should not be such as to raise the condition of the pauper above that of the self-supporting labourer, or induce any one to make the parish the first instead of the last resource in case of need (<i>Fourth Ann. Rep. App. A. No. 3</i>). To carry out this principle—to render as far as possible, without infringing the great laws of humanity, the condition of the pauper inferior to that of the independent labourer—the new system has endeavoured to confine the dispensation of relief to the walls of the workhouse. The relief of the <i>destitute</i>, and not of the <i>poor</i>, is the object of our poor-law system; and although to become permanently chargeable to a parish it is necessary that the individual should have fulfilled the condition imposed by law in the requirement of a settlement, as it is called, yet the destitution of persons, and the fact of their being within the parish or union, entitles them to immediate relief, without any regard to their settlement (<i>Instructional Letter</i>, 5th Feb. 1842). The Poor Law Amendment Act evidently contemplates, under ordinary circumstances, the adoption of the workhouse as the most effectual remedy for the evils inevitable on a state assuring to its subjects subsistence when, from misfortune or <i>misconduct</i>, they are unable to obtain it of themselves. In cases, however, where adequate workhouse accommodation has not been provided, or where large numbers of able-bodied persons are often suddenly thrown out of employment by the fluctuations of manufactures, the Poor Law Commissioners may, if they think fit, prescribe other conditions for the relief of the able bodied than admission into the workhouse (<i>Instructional Letter</i>, 30th April, 1842). The protection of the public health is provided for by various wholesome statutes, as well as by the common law. Although imperfectly administered, there is no doubt that these laws are eminently calculated to secure their purposes. Drainage, so essential to the preservation of health, is placed under the superintendence of commissioners of sewers, by the 23 Hen. VIII. cap. 5, while the highway laws, including the act 5 Eliz. cap. 13, provide for the cleansing of the public roads and ditches. The common law denounces all nuisances, public, common and private; a public nuisance being that "which is a nuisance to the whole realm; private, that which is to a house or mill," &c. (2 <i>Inst.</i> 406); a common nuisance being an offence against the public, "either by doing a thing which tends to the annoyance of all the king's subjects, or by neglecting to do a thing which the common good requires" (Hawkins, <i>P. C.</i> cap. 107). It is held to be a common nuisance, and indictable, to divide a messuage in a town, for poor people to inhabit, by which it will be more dangerous in time of infection (2 <i>Roll. Abr.</i> 139). The stopping of wholesome air is held to be a nuisance, as well as the stopping of light (Aldred's case, 9 <i>Rep.</i> 57). Similar in policy to these laws is that which treats persons who, labouring under infectious diseases,	go abroad and expose others to the infection, as liable to punishment for a misdemeanor (<i>R. v. Vantandillo</i>, 4 M. & S. 73). It is to be regretted that our modern legislation in reference to this subject—whether it is in the form of sewer acts, acts of municipal police, building acts, or the like—should be local in its operation and spirit, and so imperfect in its machinery. In the possession of good and available means of communication, a chief source of national wealth consists; but here the state, except under certain circumstances, commits to private exertion, stimulated by personal interest, what in other countries is undertaken by itself. The highways and turnpike roads, although under different regulations, are both superintended by individuals authorized thereto by the legislature, from whom they receive certain powers and general instructions. Water communications, canals and rivers rendered navigable by artificial means, are either under the control of persons acting on behalf of the public or of enterprising companies seeking their own profit, but so far contributing to the public good as to justify the state in intrusting them, though upon specified conditions, having reference to the public advantage, with large privileges and extensive authority. In this country such companies are numerous, applying their resources, derived from the combination of great wealth with disciplined talent, to various purposes, and privileged by the state, whose interests they so largely serve. It would be obviously impossible to detail the various laws by which the supreme power has endeavoured to secure the social happiness of the community. Guided by general principles, it leaves for the most part to individual prudence, and to the operation of instinctive self-love, all arrangements connected with the pursuits of industry. It has been taught by history that arrangements of this kind depend upon principles beyond its reach, and that legislative interference does little more than disturb and perplex relations which will inevitably establish themselves. Political sovereignty, conscious of its own weakness, and distrustful of its own wisdom, will not seek to derange these relations, because it is conscious that their establishment is inevitable. Between the buyer and the seller, whether of labour or its products, political sovereignty is a mediator without authority; * nor in our state does it interfere, except in special cases, and for special reasons. The usury laws, which invalidate contracts for the loan of money on exorbitant interest—the laws for the protection of shipping, manufactures, and agriculture, home and colonial—the factory laws (3 & 4 Will. IV. cap. 103), regulating the employment of labourers in the great hives of industry, and abolishing certain forms of remunerating them (1 & 2 Wm. IV. cap. 36)—and the law forbidding the employment of women and girls, and regulating that of boys, in mines and collieries (5 & 6 Vict. cap. 99), are exceptions to the general principles, and exceptions pleading in their behalf special circumstances as entitling them to exemption from a policy wise and beneficial in the main. 275. IV. FOREIGN RELATIONS. — With regard to foreign matters, the king is considered as the delegate or representative of the state (1 <i>Comm.</i> 252), and has,

Law. as such, the sole right of sending and receiving ambassadors or other ministers from foreign states. To him also is committed the duty of superintending all negotiations, and his acts are binding on the whole community.

Finance. 276. V. FINANCE.—No man is compellable to make or yield any gift, loan, benevolence, tax, or such like charge, without common consent by act of parliament, according to the ancient laws of this realm (3 Car. I. cap. 1, s. 10); and all levying of money for or to the use of the crown, by pretence of prerogative, without grant of parliament, and for longer time or in other manner than the same is or shall be granted, is equally illegal (1 Wm. & Mary, stat. 2, cap. 2). In the reign of Charles II., but not for the first time, the Commons asserted those exclusive rights in regard to the raising and appropriation of the national revenues which have ever since been conceded to them. They then resolved—(1) that all aids given to the king are the sole gift of the Commons; (2) that money bills ought to originate in the House of Commons (4 *Inst.* 29); and (3) that it was the sole right of the Commons to direct, limit and appoint, in such bills, the ends, purposes, considerations, &c. of the grants they contain* (*Comm. Journ.* 3 July, 1678). The form observed in making these grants is shortly this: the House determines, by a resolution, what sum it will vote, and then “goes,” as it is technically phrased, “into a committee of the whole House,” when every member has the privilege of speaking more than once, which is not permitted to him (except in explanation) in an ordinary sitting of the House. The means of raising the sum is then agreed on, from which circumstance the committee is called “a committee of ways and means.” The resolutions of this committee are then solemnly affirmed by a vote of the House, and a bill to effectuate the resolutions is ordered to be brought in, which is read a first, second, and third time, and sent up, like an ordi-

Exclusive privilege of the Commons.

Money bills.

* The right of Parliament to indicate the application of their supplies was familiar to the early periods of our history, a remarkable instance having occurred in the reign of Richard II. (3 *Rot. Parl.* 5, 6). Cromwell would never suffer the insertion of any clauses of appropriation in the money bills passed during his Protectorate (Clarend. *Life* and contin. vol. ii. p. 10. Oxf. 1827. Scobell, *Acts and Ordin.* vol. ii. p. 311-12, fol.). He was aware, from the example of Charles I., how much they tended to cripple the exercise of the executive power (Clarend. *Hist. Rebell.* vol. i. p. 321-2. Oxf. 1807). When such a clause was inserted in a bill passed in 1665, for raising a supply for the purposes of the Dutch war, Clarendon and Lord Ashley (afterwards Earl of Shaftesbury) vainly attempted to dissuade Charles II. from giving it his assent (Clarend. *Life*, vol. iii. p. 10-15).

This command of the public purse by the representatives of the people is undoubtedly one of the reasons that we have been exempted from that oppressive taxation which ground the yeomanry of France down to the very dust. In allusion to the French peasants, Aylmer says, “that, amongst other grievances, they pay till their bones rattle in their skin” (*Harbrowe for faithful Subjects*). Sir Dudley Carleton, in a speech delivered in the House of Commons in 1626, said, plainly in reference to France, that there the common people looked “not like our nation, with store of flesh on their backs, but like so many ghosts, and not men, being nothing but skin and bones, with some thin covering to their nakedness, and wearing only wooden shoes on their feet; so that they could not eat meat or wear good clothes, but they must be taxed unto the king for it” (2 *Parl. Hist.* 120-1). Fortescue draws a similar picture of their condition in his time, and dwells on what had long been, and was long considered, a heavy grievance. *Præterea non patitur rex quenquam regni sui salem edere, quem non eruat ab ipso rege, pretio, ejus solum arbitrio, assesso* (*De Laud.* cap. xxxv.). Philippe le Bel was very active in enforcing this obnoxious duty on salt, so much so that Edward III. called him, “son frere de la loi salique” (Barrington on 25 Edw. I.).

nary law, for the approval of the House of Lords. The Commons, however, have determined that, “in all aids given to the king by the Commons, the rate or tax ought not to be altered by the Lords” (*Comm. Journ.* 13 April, 1671)*. The bill having passed the Lords, is then submitted to the crown for its assent. Previous to the House of Commons agreeing to its votes of supply, a statement of the expenditure and receipts of the last year is laid before it, and an estimate of the probable expenses of the year, whose exigencies are then to be provided for, is also exhibited.

For a full account of the manner in which the revenue of the country is raised and applied, reference should be made to the article TAX in the Fourth Division of this *Encyclopædia* (vol. xxviii. p. 470).

277. VI. RELIGION.—Sovereignty has its moral duties as well as its legal rights. The true province of a government—what it should undertake of itself—what relinquish to the free choice of its subjects, is one of those questions hardly worth discussing, because hardly susceptible of satisfactory solution. Still we need not go very far into the philosophy of morals, where broad and deep are laid the foundations of municipal law, and whence spring the obligations to obey it, to learn that whatever is involved in the duty of a government, more at least is involved than securing to every man the quiet enjoyment of his own; that a government has hardly done its part when it has plucked the sword from the hand of civil outrage, and surrounded hall and cottage with the strong barriers of judicial protection. If man have a twofold nature, his wants, results of that nature, must be twofold in their kind; and has a government fulfilled its mission when it has consulted but one class of those wants, and that the least in moment? Surely, then, government has something to do with religion; and surely this, if for no other purpose than to sanctify and consecrate its own operations, and to enable it, in its corporate capacity, to share the blessings to be sought by its members! The state is bound up with the church, says a great lawyer, not to make the church political, but to make the state religious.

On such intelligible principles does the state concern itself with religion; and it is to us a matter of deep thankfulness that, instead of seeking for itself, in the *hortus siccus* of dissent, our state should have abided by that ancient church whose foundations were laid in the land by primitive, if not apostolic, hands. Of the Church of England, lawyers† have so written as would imply their concurrence in the calumny, that she is a parliamentary church, the offspring of troubled times. Far earlier was her date; and, in her reformation, she, in the words of Bishop Bull, “as far as it was

Duties of a government.

Connexion of church and state.

The Church of England:

catholic in spirit;

* Roger North illustrates by an anecdote which shows in a strong light the jealousy with which the Commons regarded the slightest change made by the Lords in a money bill. A money bill had passed the Commons, in which, by a mistake of the engrossing clerk, the first instalment was made payable in 1673, a year already past. When, in the first reading, in the Lords, the error was discovered, the greatest consternation ensued: to alter the bill would be to secure its rejection by the Commons; to suffer the figures to stand would be equally bad: the penknife of a clerk cut the knot; and when the bill was read a second time, the date appeared as it was originally intended to have done (*Examen*, p. 460).

† Blackstone, in his allusions to this subject, is very unsatisfactory; and a scholar should have had more toleration than to have styled the learned Anselm, the most profound and accomplished doctor of his age, “that obstinate and arrogant prelate” (1 *Comm.* 379).

Law. practicable, and the age allowed, conformed to the example of the ancient catholic church.* The position allotted her by the constitution of the country she challenges as hers of right. "Therefore," says Dr. South, "when men were led by the written word, and not by the *ignis fatuus* of a bold fancy, styling itself divine revelation,† the church was always recognised as Christ's court here upon earth, fully empowered and commissioned from him to decide all emergent controversies, to interpret doubtful commands, and to make wholesome sanctions and institutions as particular occasions and the circumstances of affairs should require; that so it might be that the assistance of the Spirit promised to the church was not a vain thing, or a mere verb."‡ It must, then, be understood, that the creation of the church was no act of the state.§ If Parliament were, as once did two of its branches usurping its authority, to vote the Church of England abolished, she would be a church no less, she would forfeit nothing but her power to command that aid of the civil power which she now possesses, and which she rewards so amply by teaching that honour is the due of the king, and that of dignities no evil is to be spoken.

her authority; not created by the state. The united church of England and Ireland. By the Act of Union with Ireland (39 & 40 Geo. III. cap. 67), the churches of England and Ireland, as then by law established, are united into one Protestant episcopal church, to be called the United Church of England and Ireland; the doctrine, worship, discipline, and government of which is to be and remain the same as already established for the Church of England, and its continuance as the Church of England and Ireland is a fundamental part of the Union.

Supreme head on earth. The king is recognised by law as the only supreme head on earth of the Church of England (26 Hen. VIII. cap. 1; 1 Eliz. cap. 1); and the independence of that church of all foreign prelates and persons whatsoever is, in affirmance of the common law, secured by a solemn act of the legislature (25 Hen. VIII. cap. 21). Right of making canons; The clergy, "one of the greatest states of the realm" (8 Eliz. cap. 1; 4 Inst. 321), as represented in the houses of convocation, have the right, if so licensed by the king, of making canons, which, when confirmed by him, operate upon and bind the clergy, so far as

* Sermons.

† Similar language was used by a great man, whose death attested his devotion to his principles. "So," says Laud, "there shall be no public service of God; but some *ignis fatuus* or other, under the name of light in the conscience, shall except against it" (*On the Liturgy*, p. 99. Oxford, 1840).

‡ Sermon xxxiv. vol. vi. p. 208. Oxford, 1823.

§ It is not to be denied that it is the popular, say rather, vulgar opinion, that the church owes its possessions to the benevolence of the state, that it is in fact a church *endowed* by the state. The fact, unhappily, is far otherwise. It is to be lamented that the state has rarely concerned itself with church temporalities any further than to appropriate them to its own purposes, or to others less holy. The spoliation of the church, under the pretence of reformation, were ably exposed by contemporaneous eloquence. "My lords and masters," says Bishop Latimer, "I say that all such proceedings, as far as I can perceive, do intend plainly to make the yeomanry *slavery*, and the clergy *shavery*. We of the clergy had too much; but this is taken away, and we have now too little" (*Sermons*, vol. i. p. 78. Lond. 1758). The poet is not less forcible:—

"We rob the church * * * * *
Men seek not to impropriate a part
Unto themselves, but they can find in heart
To engross up all: which vile presumption
Hath brought church livings to a strange consumption;
And if this strong disease do not abate,
'Twill be the poorest member in the state."
(Wither, *Abuses Stript and Whipt*, book ii. sat. 4.)

they are not repugnant to the royal prerogative, or the laws, customs and statutes of the realm (25 Hen. VIII. cap. 19; 4 Inst. 322-3). Their right to make these canons results from the king's licence, which he is empowered to give. These canons are binding on the clergy, (*More v. More*, 2 N. R. 157); but they do not, *proprio vigore*, bind the laity, unless they be enacted by Parliament (*Middleton v. Crofts*, 2 Atk. 650); for "no new laws can be made to bind the whole people of this land but by the king with the advice and consent of both houses of parliament, and by their united authority" (*per Hardwicke C. J., Ib.*)* The Convocation, to which so large an authority is intrusted, consists of two houses, the upper and lower house. In England there are two provinces, Canterbury and York, over each of which an archbishop presides, and each province has its convocation. To the upper house come the archbishop and all the bishops of the province; and to the lower house, the representatives of the clergy of the dioceses and of each chapter therein (4 Inst. 322; 1 Comm. 280). To convene, prorogue, restrain, regulate, and dissolve the convocation is the right of the king; but this once important body exercises, at present, an authority only in name, and assembles only for the sake of form.

Law. Law. binding on the clergy. Canon law binds the laity: The canon law, which, administered by the ecclesiastical courts, or, in the language of our earlier textbooks, the courts Christian, is still binding on the laity, as well as the clergy; but is so binding because, solely, it has been received and admitted either by consent of Parliament or by immemorial usage and custom in some particular cases and courts. From hence is its authority derived (*Hale, Hist. C. L.* chap. ii.).

Besides the two provinces already noticed, England is divided into parishes and dioceses, the diocese being further divided into archdeaconries and rural deaneries. This has reference to a *local* classification of the clergy, and is also *legal* in its character. The clergy may also be considered in their *spiritual* capacities according to their order in the church, as deacons, priests, and bishops. Of this classification, whose antiquity is coeval with the origin of the Catholic Church, the law takes notice. It being our part to consider them in their *legal* character, and to inquire with what rights they are clothed by law, and what duties the law expects them to perform, the first arrangement will be the most proper for our purpose.

The spiritual care of the *parish* is the business of Parish. the legally appointed minister, who is, according to circumstances, styled *parson*, or, more usually, *rector* or *vicar*. He is styled parson or rector when he is entitled to *all* the ecclesiastical dues within the parish, and vicar when entitled only to some, the remainder having been alienated. The right of nomination to a parish is in various hands. Sometimes this right belongs to the bishop, sometimes to the crown, and sometimes to private persons. By whomever exercised, it must not be exercised for money or any other corrupt consideration; for this is the offence of *simony*, so called in reference to a well-known circumstance (*Acts*, viii. 18), but one which practically defies all legislative prohibition (31 Eliz. cap. 6). To be legally nominated or presented, as the phrase is, the clergyman must be

* It has been doubted how far the canons of 1603, which, in the above case, Lord Hardwicke decided bound the clergy only, were binding in the province of York (*Rex v. Archbishop of York*, 6 T. R. 491-2. *arg.*).

Law. a priest, having been ordained in the manner indicated by the canons and liturgy of the Church of England (13 & 14 Car. II. cap. 4)—must therefore be twenty-four years of age, as that is the earliest age at which priest's orders can be obtained; but deacon's orders at twenty-three—must be presented by the patron of the advowson (that is, the person lawfully entitled to nominate)—must be instituted, as it is called, by the bishop, and properly inducted.

Institution. The institution by the bishop enables the clerk (as every duly ordained clergyman is called in law) to enter into his parsonage-house and take his tithes or ecclesiastical dues; but previous to induction he cannot lease them. Institution may be refused by the bishop—(1) if the patron have been excommunicated; (2) if the clerk be a bastard, an outlaw, an excommunicate, an alien, or similarly disqualified; or, (3) if he hold heretical opinions; (4) be of vicious life and conversation; or, (5) insufficient in respect of his learning. If the objection be one of a spiritual kind, as heresy or the like, and the patron be a layman, the bishop is bound to state his objection, or cannot, as he otherwise may, present to the living himself: but when the objection be one of another kind, as alienage, &c., or when the patron is a spiritual person or corporation (as a dean and chapter), no objection need be stated. If the bishop be patron, the acts of presentation and institution are one, and called *collation*.

Induction. Induction is the ceremony of delivering corporeal possession of the church, and endows a parson or vicar with his full rights. Vicars and curates are bound to reside in their parishes, unless their absence be licensed by their ordinary, who is in a variety of cases empowered to do so (1 & 2 Vict. cap. 106).

By this Act also, various provisions are made respecting the residence of the clergy, and former Acts are repealed by it. It forbids any spiritual person who holds a benefice from accepting another, or any cathedral preferment to hold with such benefice; and also forbids persons holding any cathedral preferment from holding with it any preferment in another cathedral. This regulation is subject to exceptions, very important and numerous, and to the power of the archbishop to grant licences of dispensation.

Perpetual curate. A parson or vicar is a corporation, his rights being continued in perpetuity to his successors. Inferior to him is the curate, who (with the exception of the *perpetual curate*, appointed by the owners of the tithes,) is named by him, to assist him in his clerical duties, and of whom the law takes properly no notice, except in the regulation, in some special cases, of his salary.

The bishop. The power and authority of the *bishop** in temporal matters consists principally in *overseeing* and correcting the manners of his clergy, whom he may punish by ecclesiastical censures through his court. He may himself be deprived by his archbishop, if guilty of any gross or notorious crime (Bishop of St. David's v. Lucy, 1 Salk. 134). The bishop presides over a diocese.

Dean and chapter. The *dean and chapter* are the council of the bishop, to assist him with their advice in matters of religion, and also with the temporal concerns of the see. The dean is sometimes nominated by the king, and some-

* It has been considered that, at common law, a bishop is a mere temporal magistrate, and is not properly to be designated bishop until the king have given him his temporalities (8 Rep. 137; 12 Rep. 9; marginal notes).

times elected by the chapter; the canons or prebendaries, sometimes by the king, sometimes by the bishop, and sometimes by each other. The *archbishop* is the chief of the bishops and clergy in his province, in which there is a diocese where he acts as a bishop. He decides all ecclesiastical controversies within his province, by way of appeal from the bishop. During the vacancy of an archiepiscopal see, the dean and chapter are the spiritual guardians; and during the vacancy of an episcopal see, the archbishop acts as such. He can resign only to the king, by whom he may be deprived for any gross or notorious crime. It is the privilege of the Archbishop of Canterbury to crown the kings and queens of England; and when he resigns his see, it must be into the hands of the king. A portion of the power usurped by the pope in this country is conferred on this archbishop by an act of parliament (25 Hen. VIII. cap. 21), empowering him to grant dispensations in any case where it may contravene neither the Holy Scriptures nor the law of God (Gibson, *Codex*, 413); and it is by virtue of this authority that he grants special marriage licences, dispensing with the necessity of observing the canonical hours, &c.

In the king, as head of the church, is the right of nomination to all bishoprics and archbishoprics vested. In the case of bishoprics created by or since the reign of Henry VIII. the nomination is direct; in other cases it assumes the form of an election by the chapter of the cathedral.

The duties of the *archdeacon* and *rural dean* have reference chiefly to the repair and condition of ecclesiastical edifices.

It will not be necessary to consider at any length the constitution of the church courts, an extensive reform in which may shortly be anticipated. "The manner of proceeding in causes for the correction of clerks" has been the subject of a late Act, "for better enforcing church discipline" (3 & 4 Vict. cap. 86).

Formerly, to borrow the expression of the great Hooker, "the Church of England and the people of England were the same people;" but, for causes not necessary to be discussed here, this is not the case at present; and therefore it is necessary to observe that, while associating itself with a church of fixed doctrines and settled formularies, the state *tolerates* other creeds and modes of worship.

Having described the objects with which the sovereign power concerns itself in this country, and the regulations which it has established in respect thereof, it becomes desirable that we should ascertain the mode in which the sovereign power itself operates, and the character of the body in which it resides.

It has been already observed, that the sovereign power of the English state is possessed by the Parliament itself, composed of King, Lords, and Commons.

278. (I.) The King.*—The illustrious person who

* Under this term is to be understood queens regnant (Mary, st. 3, cap. 1). Shortly after the accession of Mary, a person, who had been employed by Cromwell, and lately released from prison, where he had been confined for high treason, sent to the Queen, through the Chancellor of Milan, a little book, counselling her to declare that the statutes which were restrictions upon the kings of England did not extend to the queens, and that she held herself not bound by them. The Queen showed the book to Gardiner, who declared it "naught, and most horrible to be thought on;" in which opinion the Queen concurred, and threw it into the fire (Burnet, *Hist. Ref.* vol. ii. p. 558-9. Oxford, 1829).

Law. shall sit on the throne of this kingdom must be—(1) heir to the king last possessed; (2) a descendant of Sophia of Hanover, grand-daughter of James I. of England; (3) not reconciled to or holding communion with the see or church of Rome, nor professing the popish religion, nor married to a papist; but (4) joining in communion with the Church of England as by law established (1 W. & Mary, st. 2, cap. 2; 12 & 13 Will. III. cap. 2).

his attributes;

To the king our law-books ascribe the attributes which can belong in reality to none except the great Sovereign of the universe. They style him, what he is not, supreme (1 Comm. 241), and ascribe to him qualities to which never pretended those heroic and magnanimous princes who surrounded the throne of England with the imperishable halo of historic renown.

In the *idea* of the law of England, the king possesses absolute perfection (1 Comm. 426), absolute immortality (Ib. 249), and legal ubiquity (Ib. 270). In him there is no folly or weakness; he can neither think nor do wrong (Ib. 240). He never dies (Ib. 246), and is as invisible as he is immortal (2 St. Tr. 598). His legal authority is absolute and irresistible; the minister and deputy of Heaven, there is none above him but God (1 Comm. 951). He is the universal lord and original proprietor of all lands in his kingdom,—the whole soil being vested in him; nor can any subject hold lands in the kingdom but of him, directly or remotely (2 Comm. 51–9, 60; Y. B. 24 Edw. III. f. 65 b). He is the fountain of honour and dignity; all titles of nobility or otherwise are derived solely from him (1 Comm. 396). He is “in name the state itself. All the powers of the state, legislative and executive, are nominally in him” (24 St. Tr. 1183). These attributes and rights, so high and extensive, are practically subjected to the modifying operation of the common and statute law. Unhappily, instead of being considered, as great lawyers have styled them, a portion of law, they have been considered as prior in their origin, and evidences of the intrinsic authority of the king, which was called his *prerogative*† (Co. Litt. 90 b).

prerogative;

“The common law,” to quote the judicial sentiment so often cited by Sir Edward Coke, “has so admeasured the prerogatives of the king, that they can neither take away nor prejudice the inheritance of any one”

* The ancient common or traditional law considers that the king can never be subject to the disabilities of minority (Co. Litt., 43 a; Plowd. 212). It has, however, been usual, since the time of George II., when the heir to the throne has been under the age of eighteen, to pass an act of parliament providing or requiring a regency for the administration of the government in event of the crown devolving on an heir not having attained that age, until it be so attained (24 Geo. II. cap. 24; 5 Geo. III. cap. 27; 1 Will. IV. cap. 2; 3 & 4 Vict. cap. 2).

† “The king’s prerogative,” says Mr. Amos, “is nothing more than the king’s law” (Notes, Fortescue, *De Laud. Leg. Ang.* p. 44). “If you ask,” says Selden, “whether a patron may present to a living after six months by law, I answer no; if you ask whether the king may, I answer, he may by his prerogative, that is, by the law that concerns himself in that case” (Table Talk, art. Prerogative). “The law,” says Bracton, “gives to the king dominion and power” (lib. i. cap. 8). “The king’s prerogative,” says Sir Henry Finch, “stretcheth not to the doing of any wrong, for it groweth wholly from the reason of the common law, and is as it were a finger of that hand, although so much differing in fashion, that if you set them in parallels together, you shall find it to be law almost in every case of the king that is no law in the case of a subject. And yet, for all that, they are not two laws, but one law; only the common law is the *primum mobile* which draws all the planets in their contrary course” (Law, 85). See also a debate in the House of Commons (1 Rushw. 561–2), and the case of proclamation (12 Rep. 74).

(3 Inst. 84). “In governing the people,” says Fleta, “the king has none above him, except the law, which made him king, and his court, that is, the barons” (lib. i. cap. 5, s. 4). If these views be correct, and Cicero* has rightly defined what a king is, our ruler cannot properly be termed a king; nor, if Blackstone’s conception of a monarchy be just, can our state be called a monarchy (1 Comm. 50).†

Law.

“A king of England,” as Fortescue assured a Lancastrian prince, “does not bear such a sway over his subjects as a king merely, but in a mixed political capacity: he is obliged by his coronation oath‡ to the observance of the laws” (*De Laud.* cap. xxxiv.); and, as he observes in another part of his work, “a king whose government is political, can neither make any alteration or changes in the laws of his realm without the consent of his subjects, nor burden them against their wills with strange impositions” (Ib. cap. ix.). It is, however, a very singular circumstance, that Charles V. of Germany considered that the prerogatives of a king of England were considerably larger than those of a king of France; and so he told Sir Philip Hobbs, our ambassador.

Although the king, unlike the Roman emperors, is irresponsible, not *solutus legibus*, no legal remedy is available against him—an immunity he shares with his colleagues in sovereignty; yet courts of justice, as the ministers of the law, would lend him no aid to enforce any breach of the law, but would punish those that did so. It is in this way that the limitations on royal power act; and this will be sufficient to show that the king is not supreme, and is improperly denominated sovereign.

Long usage has established the maxim, that the king can act only through his servants. Considering the vast extent of our empire,—the necessity of securing, at almost every step, in almost every proceeding, the concurrence of the two houses,—the wisdom and propriety of conciliating public opinion, and allying to the acts of the crown the sympathies and approbation of the people,—it is clear that the king, in the exercise of his prerogatives, must avail himself of the

* *Cum penes unum est omnium summa rerum, regem illum unum vocamus* (See *Re. Pub.* lib. i. cap. 26).

† But see Gibbon, *Decl. and Fall*, chap. iii., and some judicious observations by Mr. Cornwall Lewis, *On the Use and Abuse of Political Terms*, p. 59–73.

‡ The Saxon kings had a coronation oath; and even the Conqueror swore, on two occasions, to observe the ancient laws. Their enemies charged Charles I. and Laud with having altered the oath, by striking out the words *quas vulgus elegerit*, and inserting “agreeable to the king’s prerogative.” By the present coronation oath the king “solemnly promises to govern the people of this kingdom of England, and the dominions thereto belonging,” to cause, as far as he can, “law and justice in mercy to be executed in all his judgments; to maintain the laws of God, the true profession of the Gospel, and the Protestant reformed religion established by the law; to preserve unto the bishops and clergy of this realm, and to the churches committed to their charge, all such rights and privileges as by law do or shall appertain unto them or any of them.” Then, laying his hand upon the holy Gospels, he is to say, “The things which I have herebefore promised I will perform and keep, so help me God;” and he is then to kiss the book. The Act of Union with Scotland (5 Ann. cap. 8) requires the king, at his accession, to take and subscribe an oath to preserve the Protestant religion and the Presbyterian church government of Scotland; and at his coronation to take and subscribe a similar oath to preserve the settlement of the Church of England within England, Ireland, Wales, and Berwick, and the territories thereunto belonging. Who can assent to the doctrine that the “coronation is but an ornament, or solemnity, or honour” (3 Inst. 7), so indignantly repudiated by Foster (*Cr. Law*, 189)?

Law.

advice, and act through the agency of others. This is a necessity, not indeed resulting from law, but the natural and inevitable sequence of circumstances and events, necessitating a course of action on which length of time and uniformity of practice—*fons omnis publici privatique juris**—have insensibly conferred the character of law, and to which they have annexed all its attendant obligations and rights.

Up to the period when this doctrine became settled, the polity of England, to borrow a judicial metaphor (Chudleigh's case, 1 Rep. 120), was half buried "in a sea of troubles, and endangered with utter drowning." The authority of the crown, when fully exercised, was constantly checked by the counter-authority of the House of Commons—*sævos compescuit ignibus ignes*,—who, that the government should perform its functions unimpeded, were required to be either subservient or supreme. It is only since the doctrine has been fully established, that the king, in using his powers, is to act in accordance with the rest of the Parliament, that the English constitution has rested on a firm and steady basis.†

Responsibility of ministers.

It has been understood from the earliest times that a minister of the king is responsible to the houses of parliament, both for the advice he gives his master and for his own conduct in his office. A learned historian considers that it was the proceedings taken by the Commons against Michael de la Pole and others, in 1386, accused of having illegally affixed the great seal to pardons, sold their influence with the judges to suitors, and dissipated the royal treasures in useless expenses and for their own benefit, which formed the first† conspicuous exercise of the formidable power of the Commons to proceed against public officers for in-

* *De Oratore*, lib. ii.

† Observations so sweeping must not rest on assertion; but, too sweeping they will not be thought by any one who studies our history from the Restoration to the accession of the House of Hanover. Read the record of the struggles between Charles II. and his Commons, each using their constitutional powers to the uttermost; and what was the result?—a tyrannical king, a rebellious assembly, and a people divided between fear of a despotism and dread of a republic; foreign money lavished to perpetuate a struggle so favourable to foreign ambition, and wise men lamenting the exile of Clarendon and the neglected counsels of his true-hearted friend Southampton, who in the sunny days of royal popularity saw the first tokens of the storm glooming on the horizon (Clarend. *Life*, and contin. vol. iii. p. 229. Oxf. 1829; Burnet, 168). The advice of Temple was slighted by the court, and, one after another, moderate men withdrew from the conflict, and left the two extremes to their common battle. The court long dispensed with a parliament, despised the one it afterwards summoned, and St. Germain's was at last the refuge of its members. And the reign of William III. affords an instance not less instructive. The House of Commons, proud of the overthrow of an ancient dynasty, was not more chary than its predecessors in the use of its extreme powers; and, at a period of disunion at home, and of danger from abroad, they thwarted the king in every exercise of his prerogative, insulted his person, alienated his affections, impeached his wisest and honestest ministers, brought the name of England into contempt, and upon themselves the just censure of one of their members, that "no one can know one day what the House of Commons will do the next" (Dalrymple, *Memoirs*, App. ii. 240).

‡ An earlier and more remarkable case was the proceedings against Robert Baldocke, bishop of Norwich, chancellor to Edward II., and a distinguished member of the Gascon party. He was charged with having advised the king to seize and waste the possessions of several churches as well as the temporalities of his own see and that of Lincoln (*Rot. Parl.* 1 Edw. III. n. 3; 2 Edward III. n. 21; 28 Edward IV. n. 4; and App. vol. i. p. 440). In this reign the Great Charter was confirmed, with a remarkable addition: "Forasmuch as many people be aggrieved by the king's ministers against right, in respect to which grievance no one can

jurious mal-administration or evil counsel (Mackintosh, 1 *Hist. Eng.* 323; *Rot. Parl.* iii. 216). Certain judges—who, in the same reign, assured the king that as he might at his pleasure remove or punish any of his officers, the Lords and Commons could not, without his licence, impeach them—were attainted; and a useful precedent was thus established, which our ancestors, in subsequent ages, jealous of their liberties, were not slow to follow. A chancellor guilty of bribery (Lord Bacon's case, 2 *St. Tr.* 1087; Lord Macclesfield's case, 16 *St. Tr.* 767), or of abusing the functions of his office (Lord Clarendon's case, 6 *St. Tr.* 331; Lord Somers' case, 14 *St. Tr.* 250); a judge advising the king contrary to law (Tresilian's case, 1 *St. Tr.* 89); or other magistrate attempting to subvert the fundamental laws or introduce arbitrary power (Lord Strafford's case, 3 *St. Tr.* 1381; Lord Clarendon's case, *ut sup. cit.*); a chancellor thought to have affixed the seal to an ignominious treaty (*Ib.*; Lord Somers's case, *ut sup. cit.*), or to a blank treaty (Burnet, 677–80); a lord admiral neglecting the safeguard of the sea (the Duke of Buckingham's case, 2 *St. Tr.* 1326; Lord Orford's case, 14 *St. Tr.* 242); an ambassador betraying his trust (Card. Wolsey's case, 4 *Inst.* 89; the Earl of Suffolk's case, 1 *St. Tr.* 91; the Earl of Bristol's case, 2 *St. Tr.* 1267); a privy councillor propounding or supporting pernicious and dishonourable measures (Suffolk's, Bristol's, and Strafford's cases, *ut sup. cit.*); or a confidential adviser of the king obtaining exorbitant grants or incompatible employments (Clarendon's, Orford's, and Somers' cases, *ut sup. cit.*; Lord Halifax's case, 14 *St. Tr.* 295–6);—in all these instances the Commons have asserted their right of impeachment.

The Parliament of 1661 exercised so frequently their privilege of impeaching the king's advisers, that it has been questioned whether they were actuated by any other motive than simply asserting their rights (Hallam, 2 *Const. Hist.* 237). James II. considered this impeaching privilege as one inconsistent with royal authority;* and his predecessor told Lord Essex that though he did not wish to be, like the Grand Seigneur, surrounded by mutes and bags of bowstrings, to strangle men at his leisure, yet "he did not think that he was a king so long as a company of fellows were looking into all his actions, and examining all his ministers as well as all his accounts" (Burnet, *Hist. own Times*, 838).

The case of the famous Earl of Danby deserves especial notice. He, being then Lord Treasurer, instructed

recover without a common parliament, we do ordain that the king shall hold a parliament once in the year, or twice if need be" (5 Edward III. cap. 29). This has been ignorantly construed to mean that every year a new parliament shall be assembled. The purpose of convoking this assembly, as stated, appears so singular as to excite surprise that it has not been adverted to by Blackstone (*Discourse on the Great Charter*, 2 *Law Tracts*, 112. Oxford, 1762).

* The observations of James are too important to be omitted. Speaking of his brother, he says: "The most fatal blow the king gave himself to his power and prerogative was when he sought aid from the House of Commons to destroy the Earl of Clarendon. By that he put that House again in mind of their impeaching privilege, which had been wrested from them by the Restoration; and when ministers found that they were like to be left to the censure of the Parliament, it made them have a greater attention to court an interest there, than to pursue that of their princes, from whom they hoped not for so sure a support" (*Life*, by himself, vol. ii. p. 593). Lord Mansfield prophesied, after Mr. Pitt's concurrence in the impeachment of Warren Hastings, that the instrument he had used against others would in time be turned against himself or his friends—a prediction fulfilled by the impeachment of Lord Melville.

Law.

Law.

our ambassador at Paris, by letter, to negotiate a peace with France, conditional on the king receiving an annuity from that country, of a certain amount and for a certain time. Our secretary of state was not to be informed of this condition. The king added a postscript to the letter, implying that it was written by *his own order*. But this was not considered as a justification of the minister (Burnet, 293-301). When the Earl of Nottingham, then chancellor, was examined touching his share in the pardon which Danby received from the king, pending his impeachment, he replied that "he neither advised it, drew it, nor altered one word of it;" and that the seal was affixed, at the king's command, by the person who usually carried it; adding, that he did not consider it in his custody at the time (7 Grey's *Debates*, 55). This was considered a sufficient justification.

Choice of ministers.

In his choice of ministers, although the king exercises his own discretion, it is understood to be, and in fact must be, a discretion governed by considerations both of the public service and of public opinion.* These indicate the necessity of his making his selection of members of both houses of parliament who are capable of there justifying their conduct, and of obtaining the concurrence of the houses in the policy they advise the king to pursue. Thus may Lords and Commons be considered, in a certain way, and to a certain extent, to share in the exercise of the royal functions, and even to specify to royalty the men it should call to its councils.

George II.

The glorious reign of George II. would be remarkable if it were only for the firm establishment of these doctrines, which have imparted security alike to the throne and the liberties of the people. George II. was disposed to plunge the nation into a war which neither concerned its interests nor could add to its glory, and dismissed (April, 1757) the ministers who refused to concur in his plans. Two months (June) afterwards, yielding, like a prudent and constitutional prince, to the unanimous voice of his people, he restored them to their employments, and added another to the obligations conferred by the wisdom and patriotism of his illustrious house on their English subjects.

Privy Council.

Formerly, in the most important functions of government, the king was advised by his Privy Council; and this is directed by law to transact all matters and things relating to the well governing of the kingdom, of which, according to the laws and customs of this realm, it has properly cognizance. All its resolutions are to be signed by such of its members as advise and consent to the same (12 & 13 Will. III. cap. 2 & 3). Any natural born subject taking the proper oaths is eligible as a member; but the last-mentioned statute disqualifies all persons born out of the king's dominions, although naturalized by parliament. The 1 Geo. I. stat. 2, cap. 4, s. 2, enacts that no bill of naturalization shall be received without a clause to this effect: but when any eminent foreigner is naturalized, it is usual to pass an Act repealing these Acts in his favour, and then to pass an Act to naturalize him. Such was the course pursued in the case of Prince Albert (3 Vic. cap. 1 & 2).

* It is well observed, in language better than ours, that it is understood that all the great powers of royalty, whether they relate to "the execution of the laws, the nomination to magistracy and office, to the conducting the affairs of peace and war, or to the ordering of the revenue, should all be exercised on national principles and national grounds" (Burke, *Thoughts on the Cause of the present Discontents*, Works, vol. ii. p. 260. 1801).

At present, the chief powers of the council have devolved upon a small committee of their number, consisting usually of the great officers of state, who alone are summoned, and are styled, in common parlance, the Cabinet Council, or more briefly, the Cabinet. This change took place when the crown first saw the policy of conciliating the various influential members of parliament by admitting them to a share in its councils. Sir William Temple, to whose advice this great change may be ascribed as a proximate cause, could hardly have foreseen the revolution in the character of our government which it has slowly and insensibly achieved.*

Law. Cabinet Council.

279. (II.) The second member of parliament is the House of Lords, composed—(1) of the English archbishops and bishops, with the exception of the Bishop of Sodor and Man; (2) of four of the Irish prelates, sitting according to a rota; (3) of the peers of England and of the United Kingdom; (4) of the sixteen Scottish peers and the twenty-eight Irish peers, elected, the first every parliament, the second for life, by the peers of Scotland and Ireland respectively as their respective representatives. To the king belongs the right of creating peers of the United Kingdom.

280. (III.) The third member of parliament is the House of Commons, the elected representatives of the people, and chosen by certain qualified persons.

Duties of Parliament.

According to the ancient form of the writ, parliament, using the term in its vulgar sense, which intends the two houses, assembled on account of "certain arduous and urgent matters touching the king and the state, and defence of the state and church of England" (4 *Inst.* 9). With such purposes it is difficult to reconcile the haughty and intemperate language of Elizabeth † and James I. The former, however, was prudent enough on some occasions to comply with the advice of her Commons (4 *Parl. Hist.* 452-82); whilst the latter provoked their famous declaration (due chiefly to the counsels of Coke, Noy, Glanville, and other great lawyers), "that the arduous and urgent affairs concerning the king, state, and the defence of the realm and of the Church of England, and the making and maintenance of laws, and redress of mischiefs and grievances which daily happen within this realm, are proper subjects and matter of counsel and debate in parliament" (Hatsell, *Privilege Ca.* 79). In earlier times, indeed, the kings were in the habit of seeking the advice, well knowing that they should need the

* On this interesting subject, so little noticed by historians or publicists, consult Temple's *Memoirs*, Works, p. 474, London, 1757; and Burnet, p. 302. Temple advised the king to admit to the Privy Council the chief leaders of the popular party, "who were of the most appearing credit in both houses;" and Gonovelt, the French ambassador, told him, "that a king of England who will be the man of his people, is the greatest king in the world; but if he would be anything more, he is nothing at all!" See a curious conversation between Henry III. and the Prior of the Hospitallers of St. John's, in Matthew Paris (p. 736).

† The queen forbade the parliament from discoursing of affairs of state, thinking that they ought not to deal, to judge, or to meddle with her Majesty's prerogative royal (Dewes, 479-645); see also *ib.* 410-70; Hatsell, *Priv. Ca.* 83; 4 *Parl. Hist.* 452-82). James I. considered that "as it is atheism and blasphemy in a creature to dispute what the Deity may do, so is it presumption and sedition in a subject to dispute what the king may do in the height of his power: good Christians will be content with God's will, revealed in his word, and good subjects will rest in the king's will, revealed in his law" (Works, 557-531). This profane comparison was familiar to the servile lawyers of the day (see Finch, *Law*, 81-3).

Law.

assistance, of the great council of the realm;* and in more recent periods the right of remonstrance has been exercised by both houses with great effect.† The dependence of the crown,‡ and of every branch of administration, on the annual supplies voted by the houses, gives to their remonstrances a practical authority obviously of the highest importance, and which prevents, in the most effectual manner, the abuse of the powers intrusted to the executive officers of the realm. It is held the first duty of these houses "to refuse to support [a] government [as the king's servants or ministers are called] until power was in the hands of persons who were acceptable to the people, or while factions predominated in the court, in which the nation had no confidence." (Burke, *Thoughts on the present Discontents*, Works, vol. ii. 263).

Declara-
tion of
Rights.

The two houses of parliament have, on two memorable occasions in our history, exercised an extraordinary power, justified by extraordinary circumstances, but establishing an important precedent. From the Declaration of Rights, afterwards embodied in the Bill of Rights (1 Will. & M. stat. 2, cap. 2) we may gather the principles on which "the glorious revolution of 1688" was undertaken.§ The declaration states that James II. had endeavoured to subvert and extirpate the Protestant religion, and the laws and liberties of the kingdom; it enumerates the overt acts evidencing such endeavour, all which it stigmatizes as contrary "to the known laws and statutes and freedom of this realm." It declares that James had abdicated the throne, which was thereby vacant. After reciting fur-

* See *Rot. Parl.*, 13 Edw. III. n. 6; 21 Edw. III. n. 58; 28 Edw. III. n. 59; 6 Rich. II. n. 14-5; 7 Rich. II. n. 16; and Brown's *Miscellanea Aulica*, 205. These are amongst the earliest instances of a king seeking the advice of his parliament in relation to foreign affairs. It has been contended that in negotiations with foreign powers, the king can act *ex mero motu*, and without communication with even his privy council; and when he does consult them, he is not bound to follow their advice (Burnet, 677-8).

† Sometimes the remonstrance has been against the counsellors with whom the king has surrounded himself, and sometimes against the policy he has pursued. In the reign of Henry VI. (1451), the commons prayed the king to dismiss certain peers and other persons from his person and councils for ever (Hume, chap. xxi.). The most memorable instances of the influence of the Commons in thwarting the ambitious designs of a king, were, perhaps, those of the addresses of the house which forced Charles to abandon his pretended prerogative of dispensing with the penalties (*Com. Journ.* 27 Feb. 1672), and suspending the operation of laws relating to the church (Burnet, 205-32). The remonstrances of the Commons with Charles II. on the marriage of his brother with Mary d'Este, and their spirited conduct, which broke up the cabal ministry, are described in 2 Grey's *Debates*, 190, 214-22-39.

‡ Edward I., in the twenty-seventh year of his reign, plainly stated that the large grants and supplies he had received formed the sole reason of his having agreed to the confirmation of the great charters. It must not, however, be supposed that this dependence was without its advantage to the crown, for thereby its revenue became much more easily collected. The difficulties which beset the royal commissioners appointed to collect, or rather solicit, the pecuniary aid of the people, ere the privileges of the Commons were established, are amusingly illustrated in a letter addressed to Hubert de Burgh, "the justiciar and king's counsellor," by the royal chamberlain. Mr. Lyson's abstract of this letter is to be found in Sir Francis Palgrave's *Report* for 1831-4, and which may be found in the Appendix (XVII.) to Mr. C. P. Cooper's (privately printed) *Statement respecting the new edition of Parliamentary Writs* (p. xi.).

§ The absurd doctrine of an original contract between king and people—so false in fact, so idle in theory—is not noticed in this great declaration. It is to be found in a resolution of the House of Commons (*Journals*, 28 Jan. 1688, O. S.), and may be characterized as a vain attempt to incorporate into the institutes of English public law a decision, doubtful in its value, of one of the most vexed and least determinable of ethical questions

ther, that the Prince of Orange, by the advice of the house and others, had summoned the convention from which this declaration issued, and which asserted itself to be assembled "in a full and free representative of the nation," it solemnly denounced all the illegal acts of James it had previously mentioned, and, on behalf of the nation, claimed the premises as their ancient and undoubted rights. In the hope that the prince would perfect the deliverance he had begun, they stated their resolution that he and the Princess of Orange should be, and they thereby declared them to be, king and queen of England, France, and Ireland. It is easy to distinguish in this great act the constitutional from the revolutionary principles on which it proceeded. So far were those principles revolutionary as they concerned the right of the houses to judge how far James had abdicated; for if abdication involved the idea of intention (*voluntas*), who would affirm that James had abdicated, seeing that he had himself signified his intention of returning? And could his have been considered as an abdication which would be binding on his posterity? The necessity of the case forced them into this construction of his conduct, for they did not desire to establish the doctrine asserted, with less prudence, but with greater boldness, by the Scottish Estates, that by violating the fundamental laws of the realm, he "had forefaulted the right to the crown" (*Account of the Proceedings of the Estates of Scotland*, &c. p. 35), nor to give any authority to doctrines falsely ascribed to them since, which assert the rights of a people to "cashier kings for misconduct." Still, whatever their language may have been, so far their conduct was revolutionary. In what, then, was it constitutional? So far as it asserted their right, the throne being vacant, to fill it; their right to provide for the defect of royal power, by clothing another with its functions; their right to restore a portion of the supreme authority, which had, in some way or other, become wanting to the state. And this right, in less troubled days, they asserted with success. In 1789, the unhappy malady of the king produced a temporary interruption to the exercise of the royal authority. Mr. Fox, prompted, it has been said, by Lord Loughborough, declared that the heir apparent, being of full age, "had as clear, as express a right to assume the reins of government, and exercise the power of sovereignty, during the continuance of his Majesty's incapacity, as if his Majesty had a natural demise" (27 *Parl. Hist.* 707). Mr. Pitt, however, stood forward as the champion of constitutional rights, and asserted "that in case of an interruption of the royal authority without any previous lawful provision having been made for carrying on the government, it belonged to the other branches of the legislature, on the part of the people at large—the body they represented—to provide, according to their discretion, for the temporary exercise of the royal authority, in the name and on the behalf

Law.

Principles
of the Re-
volution of
1688.Right to
supply the
deficiency
of royal
authority.

* It is impossible to deny, that in the conference between the houses on the word "abdicated," for which the lords would have substituted "deserted," their lordships had the best of the argument. But then the results of their success! what mischief would it not have caused! It was the exigency of the occasion that justified what was done, and against this, of what value were all the arguments of the publicist, though he might

"— quote Puffendorf and Grotius,
And prove by Vattel,
Exceedingly well,
That the deed was quite atrocious?"

Law. of the sovereign, in such manner as they should judge requisite" (*Ib.* 709.) Again, "the Lords and the Commons represented the whole body of the people, and with them it rested as a right—a legal and constitutional right—to provide for the deficiency of the third branch of the legislature, whenever a deficiency arose. They were the legal organs of speech for the people, and such he (Mr. Pitt) conceived to be the true doctrine of the constitution As the power of filling the throne rested with the people at the Revolution, so at the present moment, on the same principle of liberty—on the same right of Parliament—did the providing for the deficiency" (*Ib.* 741-2). At the present day, and in the mind of no constitutional lawyer, can a doubt exist as to the soundness of Mr. Pitt's positions, which are worthy of being thus stated in full, not only from the character of the statesman, and the importance of the occasion, but because they espoused a principle which lies at the very root of the constitution—the sole source of our public law.

Such is the Parliament, whose harmonious action is necessary for the sovereign power to act advantageously for the public, whose interests it is presumed to guard.

Forms of
legislation.

The forms observed in legislation are regulated by the custom of Parliament, to be observed or omitted at its will. They are as follows. Every law, in its inception condition, is termed a *bill*. With the exception of bills of grace or pardon, which usually emanate from the crown,—of bills relating to the rights of the peerage, to the election and qualification of members of the House of Commons, and to the raising or disposition of monies to the public use (the first of which usually originate in the House of Lords, and the latter uniformly in the House of Commons), either house may (which the king, with the exception above stated, cannot) initiate any bill. The bill is in writing, and submitted in succession to both houses, the opinion of which is taken in reference to it, as a whole, four times, on the first, second and third readings, as the stages are technically called, and on the motion "that this bill do now pass;" and between the second and third times the bill is proposed clause by clause, when any alteration or addition may be made in any of the clauses. Clauses may be added also on the third reading, or previously, when the committee report the bill to the house; but all additions and alterations must be approved by both houses before the bill can be considered to have been assented to by them. It is proper to add, that in the case of bills originating in the House of Commons, leave must be obtained from the house before the bill can be "brought in;" nor can any bill be introduced affecting the rights of the crown without its permission. At any stage of the bill, it may be referred to the consideration of a select committee, named by the house under whose consideration it is, out of their members; and the House of Lords is in the habit of referring certain bills to the opinion of the learned judges. When all the above forms have been complied with, the bill is submitted to the king, who gives or withholds his consent.

The king cannot suspend or dispense* with these laws of Parliament, or any other laws, on any pretence

* The practice of dispensing with statutory penalties is supposed to have been commenced by Henry III., in imitation of the popes, and was recognised as lawful by many eminent lawyers (*Luder's Law Tracts*, vol. ii. p. 327). It did not extend to the common law, nor to statutes relating to things necessary for the good of the church or commonwealth, and in which all the king's subjects have an interest (*3 Inst* 154). Such a practice as this is plainly inconsistent

whatever (1 Will. & M. stat. 2, cap. 2). But he* has the power, sometimes, in virtue of his prerogative or right of pardoning offenders, of suspending their full operation as to particular persons (27 Hen. VIII. cap. 24). But this is subject to one important exception (31 Car. II. cap. 2). And the right of dispensing with or suspending laws has been also by one house of parliament abjured, for themselves and their successors (*Lords' Journ.* 4 Feb., *Commons' Journ.* 16 Feb. 1784).†

with the declaration of Fortescue, that without consent of parliament, the king cannot alter the laws (*De Laud.* cap. xxxvi.); but is quite compatible with the opinions of Herbert, Chief Justice to James II., who said "that the laws of England are the king's laws, and that therefore it is the inseparable prerogative of the kings of England to dispense with them."

* Even a king *de facto* (*Bro. Abr.* tit. *Charter de Pardon*, 22).

† One word must be permitted in reference to the privileges of the two houses. Upon this subject very confused notions evidently pervade the minds of the public, or a late controversy would have never occurred. Undoubtedly, the Houses of Lords and Commons are, like the king, directly, and, in themselves, irresponsible. "The freedom of speech, and debates and proceedings in parliament, ought not to be impeached or questioned in any court or place out of parliament" (1 Will. & M. stat. 2, cap. 2). "The independence of parliament is the corner-stone of our free constitution," and "the judges who invaded it in the reign of James I. and his son, have justly shared with those who betrayed the rights of the people in the case of ship money, the abhorrence of all enlightened men" (*per Denman C. J.*, *Stockdale v. Hansard*, 9 A. & E. 110).

The judges are, however, judges of the law; and if either house were to transcend its privileges, "and the subject comes judicially before a court of law, a court of law will not swerve from its duty, but decide according to law" (*per Kenyon, C. J.*, *R. v. Wright*, cit. 6 St. Tr. 1124). In reference to a question respecting a parliamentary election, a learned judge said, "For myself, I will never be bound by any determination of the House of Commons against bringing an action at common law against a false or double return; and a party injured may proceed in Westminster Hall, notwithstanding any order of the house" (*per Wilmot C. J.*, *Wynne v. Middleton*, 1 Wils. 128).

It is true that the judges cannot reach the house, nor could the judges reach the king, were he to exceed the lawful bounds of his prerogative; but, as the fact is, from the necessity of the case, neither king nor house can act, except through agents, and these agents the judges can reach. It is true that the house could retort by committing the judges; but this would be to suspend the constitution, for the independence of the judges is as much guaranteed by the constitution as the independence of the House of Commons. If it be asked, then, whether privilege is bounded by law? it is answered, yes; privilege is bounded by law, as prerogative is bounded by law; as the authority of the courts, the powers of magistracy, the rights of the people, are bounded by law, by law defended, and by law defined.

The question has been involved in great mystery. Strange language has been used, and hints and insinuations thrown out, that these privileges are original and essential attributes of the Commons House, not to be reached by legislation, not defined nor to be defined, and not understood nor to be understood. Such also was prerogative said to be before the great revolution. But parliamentary privilege is not of such recondite learning: "experience hath made" it "well known to parliament men" (4 *Inst.* 4). We have the "means of knowing what are the privileges of the House of Commons" by consulting "the records of that house," and by searching "into the history of parliament for those cases in which a claim of privilege has been made, and examine whether it has been admitted or refused" (1 *Hatsell, Preced.* 1-2). "The law of parliament," says Mr. Hallam, "as determined by regular custom, is incorporated with our constitution, but not so as to warrant an indefinite uncontrollable assumption of power in any case" (*Mid. Ages*, ch. viii.) "No resolution of either house of parliament can make that a legal privilege which was not so before; the law of parliament may be expounded from time to time, but cannot be altered without the authority of the whole legislature" (*Dwarris, On Stat.* 68).

No one is disposed to deny that the House of Commons has privileges; and, according to the high authority of Mr. Hatsell, these appear to have been defined by a resolution agreed to by the house, on the motion of Sir Edw. Coke, in 1621 (*Priv. Ca.* 160). But "power, and especially the power of invading the rights of others,

Law.

Law.
Crimes.

In concluding the consideration of public law, we shall consider the chief of those wrongs which are presumed to be perpetrated to the injury of the public, and are called *crimes*.

281. We shall first treat of those crimes only which are properly to be considered as committed against the state, and in which the injury to individuals is only accidental.

High
treason.

(1.) *High treason*, the most heinous crime acknowledged by the law, is defined by the statute 25 Edw. III., the provisions of which have been extended by the 36 Geo. III. cap. 7 (a temporary Act, made perpetual by the 59 Geo. III. cap. 6). Of high treason there are several species: (1.) Compassing or imagining the death of the king, queen consort, or their eldest son and heir. (2.) Violating the queen consort, the king's eldest daughter unmarried, or the wife of his eldest son and heir. (3.) Compassing, imagining, inventing, devising, or intending death, destruction, or any bodily harm tending to the death, destruction, maiming, wounding, imprisonment or restraint of the person of the king; or, (4.) to deprive or depose him from the style, honour, or kingly name of the imperial crown of this realm, or other his dominions. (5.) Levying war against the king in the realm, and compassing, imagining, inventing, &c. such levying, in order by force or constraint to compel the king to change his measures or councils; (6.) or in order to put any force or constraint upon, or to intimidate or overawe either or both houses of parliament. (7.) Being adherent to the king's enemies in the realm, and aiding them there or elsewhere. (8.) Moving or stirring any foreigner or stranger with force to invade the realm or other the king's dominions. (9.) Counterfeiting certain of the king's seals (11 Geo. IV., & 1 Will. IV. cap. 66). (10.) Slaying the chancellor and certain other judicial officers, being in their place doing their offices. All such compassings, imaginations, inventions, &c. must be expressed, uttered, or declared by publishing any printing or writing, or by any overt act or deed.

In cases of treasonable attempts on the life or person of the king, the culprit is to be tried as if he were charged with murder (39 & 40 Geo. III. cap. 93; 5 & 6 Vict. cap. 51). The *punishment* remains as in other cases. The chief distinction in the proceedings at a trial for high treason, from all other trials, is the necessity of having (except in the cases above mentioned) the overt acts, which evidence each treason, proved by

is a very different thing from privilege: it is to be regarded, not with tenderness, but with jealousy; and unless the legality of it be most clearly established, those who act under it must be answerable for the consequences" (*per* Patteson J., *Stockdale v. Hansard*, 9 A. & E. 214).

"In one sense," says Coleridge J., "the house alone is to judge of its own privileges. In the case of a recognised privilege, the house alone can judge whether it has been infringed, and how the breach is to be punished;" but he repudiated the doctrine "that the house is alone and exclusively the judge of its own privileges, in the sense that it alone is competent to declare their number and extent; and that whatever the house shall resolve to be a privilege, is by such resolution conclusively demonstrated to have been so immemorially" (*Id.* 218). Hear a high authority on this head: "Parliament men," says Selden, "are as great princes as any in the world, when whatsoever they please is privilege of parliament; no man must know the number of their privileges; and whatsoever they dislike is breach of privilege. The Duke of Venice is no more than the Speaker of the House of Commons, but the senate at Venice are not so much as our parliament men, nor have they that power over the people, who yet exercise the greatest tyranny that is anywhere" (*Table Talk*, art. Parliament).

two witnesses (7 Will. III. cap. 3, s. 2, 4). On this subject, see the article TREASON in the Fourth Division (vol. xxviii. p. 739).

(2.) *Misprision of treason*, which consists in the Misprision bare knowledge and concealment of treason, without of treason. any assent thereto; punished by loss of the profits of lands for life, forfeiture of goods, and imprisonment for life (1 Hale, P.C. 374).

(3.) *Sedition*.—Fairly, and with temperance, decency, and respect, to discuss the policy of the king and ministers, without imputing to them corrupt motives, is without question lawful (*R. v. Lambert et al.*, 2 Camp. 398). Nor would this be a free country if it were not so. But cursing the king, wishing him ill, spreading tales against him, or doing whatever tends to lessen him in public esteem, and to embarrass his government, by lessening him in the eyes of his people (*R. v. Tuchin*, Holt, 424), and by alienating their affections from him, are all so many seditions, and this whether any ill effects had been intended or not, and whether the expedients used were ridicule or obloquy. (*R. v. Cobbett*, Holt, *On Lib.* 529; *R. v. Burdett*, 14 East, 150; *R. v. Harvey*, 2 B. & C. 257). The punishment for sedition is fine and imprisonment.

(4.) *Præmunire*.—A class of offences which derive *Præmunire* their name from the initial word of the writ or process framed for the execution of certain statutes made against the exorbitant pretensions of the see of Rome.* The 16 Ric. II. stat. 5 (*execrabile illud statutum*, as it is, naturally enough, styled by Martin V.), usually styled the Statute of *Præmunire*, enacts, that whoever should procure, at Rome or elsewhere, any translations, processes, excommunications, bulles, instruments, or other things which touch the king, against him, his crown and realm, and all persons aiding and assisting therein, shall be put out of the king's protection, their lands and goods forfeited to the king's use, and they shall be attached by their bodies to answer to the king and his

* It has become the fashion to ascribe the Acts against Roman Catholicism, or, more properly, popery, to the intolerance of the Reformers, who sought to fetter conscience by laws. But if we read the early history of the Anglican church, we shall find that the excesses of Roman ambition were then guarded against with a zeal for her spiritual independence not one whit less affectionately jealous than they have been since. The Anglo-Saxon clergy were distinguished by their unfriendliness to transmontane doctrines and precepts (*Kemble, Cod. Dip. Æv. Ang.-Sax.* pref.); and even in our darker ages there were not wanting wise princes and holy prelates who asserted the liberties and free rights of the Anglican church (*See* Mr. Churton's admirable work on the *Early English Church*). Politically speaking, what could have been done with Rome when one of her bishops (Pius V.), after declaring, in a bull dated March, 1569, that, "as successor of St. Peter, he was constituted by Him who ruleth on high over all nations and all kingdoms, that he might pluck up, destroy, dissipate, ruin, plant and build," went on—"We deprive her [Queen Elizabeth] of her pretended right to the kingdom, and of all dominion, dignity, and privilege whatsoever, and absolve all the nobles, subjects, and people of the kingdom, and whoever else have sworn to her, from their oath, and all duty whatsoever, in regard of dominion, fidelity, and obedience." (*Camden, Annales, sub anno 1570. See also* Caudrey's case, 5 Rep. xl.) The oath which was taken by the pope's collector, before the rupture of the Anglican church with that of Rome, is worth preserving, as a proof that the first clause of Magna Charta—*Ecclesia Anglicana libera sit et habeat omnia jura sua integra et libertates suas illæsas*—was not suffered to be wholly a dead letter. "*Nullam executionem literarum vel mandatorum Domini Papæ per me vel alium, faciam nec fieri permittam, quæ poterit esse præjudicialis Regiæ Majestati dicti Domini nostri Regis, aut Regaliâ, legibus vel juribus suis vel eidem Regno. Nullas literas Papales nec alias recipiam, nisi eas sitiis, quo potero, deliberavero concilio dicti Domini nostri Regis antè quam publicentur seu deliberentur alicui personæ viventi.*"

Law.

council, or process of *præmunire facias* shall be made out against them. Those are guilty of *præmunire*—(1.) Who appeal to Rome from any of the king's courts, sue there for any licence or dispensation, or obey processes issuing thence (24 Hen. VIII. cap. 12; 25 Hen. VIII. cap. 19 & 21). (2.) Who, being a dean and chapter, refuse to elect, or an archbishop or bishop, refuse to consecrate, any one named by the king to any see (25 Hen. VIII. cap. 20). (3.) Who assert maliciously and advisedly, by speaking or writing, that either or both the houses of parliament have a legislative authority without the king (13 Car. II. cap. 1). (4.) Who send any subject of this realm a prisoner beyond sea—an offence involving heavier penalties, and which the king himself cannot pardon (31 Car. II. cap. 2). (5.) Who assert maliciously and directly, by printing, writing, and advisedly speaking, that the Pretender or any person, other than according to the Acts of Settlement and Union, is king, or that the king and parliament cannot make laws to limit the descent of the crown (6 Ann. cap. 7). (6.) Who knowingly and wilfully solemnize, assist, or are present at any forbidden marriage of any descendant of George II. prohibited from contracting matrimony without the consent of the crown (12 Geo. III. cap. 11). These are the chief offences of *præmunire*. The punishment is thus stated:—"That, from the conviction, the defendant shall be out of the king's protection, and his lands, tenements, goods and chattels forfeited to the king; and that his body shall remain in prison at the king's pleasure, or (as other authorities have it) during life" (*Co. Litt.* 129 b).

Disobedi-
ence to
royal com-
mand.

(5.) The king, as the representative of the state, is entitled to demand, for the purposes of the state, the services of his subjects. To refuse, therefore, to assist by advice in the councils of the king, to aid in the defence of the realm, to yield assistance to the civil power by joining in the *posse comitatus*, to attend the privy council, being thereto convoked by royal summons, to return from abroad at the royal command, or to go thither when in like manner forbidden, or to serve an office to which one was duly elected, is punishable with fine or imprisonment, or both.

Unlawful
oaths.

(6.) *Unlawful oaths*.—To administer, or aid, abet or consent to the administering of oaths binding the persons taking the same to engage in mutinous or seditious purposes, or disturb the public peace, &c., is felony in those who administer and those who take the same, and punishable with transportation for not more than seven years (37 Geo. III. cap. 173). The oaths must purport to bind those taking them—(1) to engage in some mutinous or seditious undertaking; (2) to disturb the public peace; (3) to be of some association formed for such purpose; (4) to obey orders of a committee or body not lawfully constituted, or of a leader or other person having no lawful authority for that purpose; (5) to abstain from informing or giving evidence against any associate or other person; (6) and from revealing any unlawful combination, (7) illegal act done or to be done, or (8) any illegal oath administered, tendered to, or taken by such person, or to or by any other person, or the import of any such oath. It is felony to administer, cause to be administered, or aid or abet in administering unlawful oaths, purporting to bind the party taking the same to the commission of treason or felony. He who administers or aids &c. in administering such oaths is punishable by transportation for life, or for not less than fifteen

years, or by imprisonment for not less than three years (7 Will. IV. and 1 Vict. cap. 91); and he who takes them is punishable with transportation for life, or a shorter period, if the court thinks fit (52 Geo. III. cap. 104).

Law.

(7.) *Inciting to mutiny*.—To seduce any soldier, sailor or marine from his duty or allegiance, to incite or stir him up to an act of mutiny, to make or endeavour to make a mutinous assembly, or commit any traitorous or mutinous practice whatsoever, is felony, punishable, under the 7 Will. IV. and 1 Vict. cap. 91, as above mentioned.

(8.) *Stealing or embezzling naval or military stores* is punishable with transportation for life, or not less than seven years, or by imprisonment, with or without hard labour, for not less than seven years (4 Geo. IV. cap. 53). If the value of the stores be under twenty shillings, the offender may be fined, at the discretion of a certain officer connected with the department to which the stores belonged (1 Geo. I. stat. 2, cap. 25). The security of the public stores is likewise provided for by other acts of parliament.

Stealing or
embezzling
naval or
military
stores.

We have now to treat of offences against public justice. Judicial

(1.) *Extortion of officers of justice*, who, under pre-tence of authority, extort illegal fees from prisoners, is punishable with fine or imprisonment, or both.

(2.) As also is *bribery*, or attempting to bribe such an officer (3 Inst. 147); and an officer, judicial or ministerial, taking a bribe, is punishable in the same way.

(3.) *Misconduct of officers of justice*, being what the law terms malfeasance, that is, wrong-doing,—or culpable non-feasance, that is, neglect of an officer of justice in regard to his office,—is a misdemeanor, punishable with fine or imprisonment, or both.

When magistrates are guilty of oppression or other wilful malfeasance in the execution of their duties, they are generally proceeded against by information in the King's Bench. The punishment is fine or imprisonment, or both.

(4.) He who negligently suffers the escape of one lawfully in his custody in respect of some criminal charge, is punishable by fine; and he who so escapes is punishable by fine and imprisonment. A voluntary escape amounts to the same offence, and is punishable in the same manner as the offence of which the prisoner is guilty, and for which he is in custody. The officer, however, cannot be thus punished until after the original delinquent has been found guilty and convicted.

Escape.

(5.) *Prison-breach*, or breaking out of prison, is felony, if the defendant were in custody for treason or felony (1 Edw. II. stat. 2), punishable by transportation for seven years, or imprisonment for not exceeding two, with or without hard labour, or solitary confinement for the whole or any part of the same (7 & 8 Geo. IV. cap. 28); and, if a male, to be once, twice, or thrice publicly or privately whipped, in addition to the imprisonment, if the court thinks fit (7 & 8 Geo. IV. cap. 28). If the defendant were in custody for any other offence, he may be punished by fine or imprisonment. Aiding and assisting prisoners escaping from prisons (certain prisons excepted, for which special provision is made,) is felony, punishable by transportation not exceeding fourteen years (4 Geo. IV. cap. 69). To aid them in escaping from constables or officers conveying them under warrant to prison, is felony, punishable by transportation for seven years (16 Geo. II. cap. 31). Assisting prisoners of war to

Prison
breach

Law. escape is felony, punishable by transportation for life, fourteen or seven years (52 Geo. III., cap. 156).

Return from trans-
portation. (6.) A transported convict, returning before the expiry of his sentence, is punishable with transportation for life, or for not less than seven years, or imprisonment for not less than three years (4 & 5 Vict. cap. 56), with or without hard labour, for not more than four years.

Perjury. (7.) *Perjury* may be defined to be a crime committed when a *lawful oath* is administered in some *judicial* proceeding, entertained by a competent jurisdiction, to a person who swears wilfully, absolutely, and falsely, with deliberation and intention, on a point material to the matter in question (3 *Inst.* 164; *R. v. Aylett*, 1 *T. R.* 69, 1 *B. & A.* 21). Perjury is punishable at common law with fine, imprisonment, and hard labour (3 Geo. IV. cap. 114), at the discretion of the court; and by the 2 Geo. II. cap. 25, the judge may order the party to be transported, or imprisoned and kept to hard labour, for not more than seven years. False affirmations by Quakers, Moravians, and other separatists, are punishable in the same manner, under divers acts of parliament. Subornation of perjury is punished in the same manner as perjury.

Com-
pounding
of felony. (8.) *Compounding of felony* is when one, for consideration of reward, agrees to forbear the prosecution of a person who has committed a felony against him. It is punishable with fine and imprisonment. And compounding of informations upon penal statutes, without the permission of the court, is punishable by a fine of ten pounds, and incapacity for the future to sue on any popular or penal statute (18 Eliz. cap. 5). Taking a reward for the recovery of stolen goods is felony, punishable with transportation for life or not less than seven years, or imprisonment for not more than four years, with or without hard labour or solitary confinement for the whole or any part of the same; and, if a male, to be whipped, once, twice or thrice, if the court thinks fit (7 & 8 Geo. IV. cap. 29; and see 5 & 6 Will. IV. cap. 38).

Conspiracy (9.) A *conspiracy* is an agreement between two or more persons, (1) falsely to charge another with a crime, either from malice or to extort money; (2) wrongfully to injure any person or persons in any other manner; (3) to commit any offence punishable by law; (4) to do any act with an intent to pervert the course of justice; (5) to effect a legal purpose with a corrupt intent, or by improper means; (6) to which we may add, conspiracies or combinations of journeymen to raise their wages, &c. (Archbold, *Crim. Plead.* 579-80). Conspiracy is, at common law, a misdemeanor, punishable by fine or imprisonment, or both.

Offences against social economy are now to be considered.

Coining. (1.) *Coining*.—The right of coining money, and fixing its denomination, is reposed by law in the king; and anciently (25 Edw. III.) its violation, by counterfeiting coin, was punishable as high treason.* The present law, which, it would seem, has impliedly repealed its predecessor, is very properly milder in its provisions. The making or counterfeiting of gold or silver is felony, punishable, at the discretion of the

Law. court, by transportation for life, or not less than seven years, or by imprisonment for not more than four years, with or without hard labour, or solitary confinement during the whole or any part thereof (2 Will. IV. cap. 34). To impair, diminish, or lighten gold or silver coin, with intent to make the same pass current, is a felony, punishable by transportation for not more than fourteen or less than seven years, or imprisonment, with or without the aggravations above mentioned, not exceeding three years (*Ib.*). Disposing of, or receiving, or offering so to do, counterfeit gold and silver coin at less than their pretended denominations, is punishable in the same manner as counterfeiting the same. The counterfeiting of copper coin is less severely punished. The statute, however, contains a variety of provisions well calculated to ensure the purity and authenticity of our circulating medium.

(2.) *Nuisance*.—Anything that is injurious to the health, personal safety, morals, convenience, or comfort of the public, is held to be a common nuisance. The offences included under this head have each their appropriate punishment assigned by law. They are, however, too numerous to be detailed here; nor will it be expected that we should treat of smuggling, or offences against fiscal laws, which, from their nature, are continually fluctuating.

Offences against the public peace now claim our notice, of which the most important is—

(1.) *Riot*, which is where three or more assemble together—their assemblage being accompanied with circumstances of either actual force or violence, or of apparent tendency thereto, as if they are armed, use threatening language, turbulent gestures, &c., calculated to inspire terror—and then proceed to execute their design, and actually do execute it (*R. v. Hughes*, 4 C & P. 372; *R. v. Birt*, 5 C. & P. 154; 1 Hawkins, c. 65, s. 1-5). It is immaterial whether the act done be unlawful or not, if so done as to inspire people with terror. Riot is punishable by fine or imprisonment, and by hard labour (3 Geo. IV. cap. 114). Where twelve or more persons are engaged in a riot, and they remain together one hour after proclamation made, according to 1 Geo. I. stat. 2. cap. 5, they are punishable by transportation for life, or for not less than fifteen years, or to be imprisoned for not exceeding three years (7 Will. IV. and 1 Vict. cap. 91). Even to oppose the making of the proclamation is punishable in the same way.

If persons assemble together on a lawful occasion, as for innocent diversion, &c., and, suddenly quarrelling, fight, it is but an *affray*, and no riot, unless indeed, previous to fighting, they form themselves into parties with promise of mutual assistance. Affray is punished by fine or imprisonment, or both; but to constitute an affray, it must have taken place in a public street or highway. Riot is also to be distinguished from what is called a *route*, which is, when such an assembly as is first described proceeds to execute its design, but does not effect the same; and if it does not so proceed, it can be dealt with only as an unlawful assembly.

(2.) *Threatening letters*, which we have treated so fully in another place as to require no mention here (see Division IV. vol. xxviii. p. 611).

We have postponed to this place the consideration of another class of crimes, some of them more heinous in their character than those we have been discussing; and our arrangement has had reference simply to the

* *Sicut legem figere signum est summi imperii, ita et nummum cudere, nam νόμισμα, ut docet Aristoteles, et nomen suum et vim habet ἀπὸ τοῦ νόμου. Hinc majestatis criminibus accensetur nummos corrumpere.* (Grotius, *Annotationes in Novum Testamentum*, Matr. xxii. 20, p. 85. London, 1727).

Law. convenience of treating them in a body, while some of them are cognizable only by peculiar tribunals. The crimes to which we allude are those committed against the ordinances of the church.* Of these, the chief are:

Apostasy. (1.) *Apostasy*, which is a total renunciation of Christianity, is an offence properly to be punished in the ecclesiastical courts, which correct the offender *pro salute animæ*. The temporal law interferes in the matter no further than to incapacitate any person educated in, or having made profession of Christianity, who, by writing, printing, teaching, or advised speaking, shall deny its truth and the authority of the Holy Scriptures, on the first offence, for holding any office or place of trust; and on the second, for bringing any action, and for being guardian, executor, legatee, or purchaser of lands; and it subjects him, moreover, to three years' imprisonment, without bail (9 & 10 Will. III. cap. 32). This does not extend to those denying the divinity of one of the persons of the Holy Trinity (53 Geo. III. cap. 60). The delinquent, who within four months after the first conviction publicly recants his errors, is discharged from all his disabilities.

Heresy. (2.) *Heresy*† is the public and obstinate denial of some essential doctrine or doctrines of Christianity, and is defined by Sir Matthew Hale as *sententia rerum divinarum humano sensu electa, palam docta, pertinaciter defensa* (1 P. C. 384).

It is a crime to be punished by spiritual censures only, and one of which the ecclesiastical judge solely has direct cognizance, and his jurisdiction is not assisted by the temporal law (29 Car. II. cap. 9), though he ought not to declare any opinion to be heresy which has not been so declared‡—(1) by the Canonical Scriptures; (2) by the four first general councils, or such others as have used the words of the Holy Scriptures; (3) or which shall be hereafter declared heresy by the Parliament, with the assent of the clergy in convocation (1 Eliz. cap. 1). Excommunication, the most powerful engine which the spiritual judge could use, is now attended with no civil disabilities whatever (53 Geo. III. cap. 127, an act which extends to England only). Incidentally, also, the question of heresy may be determined by the temporal courts, as in an action at law against a bishop for non-institution of a clerk, where, if he defends himself on the ground that the clerk held heretical opinions, the court will be bound to ascertain the truth of the defence (1 Hawkins, P. C. cap. 2).

* Blackstone styles them offences "against God and religion," a title so general, that it would embrace every species of crime.

† The first statute against heresy is the 5 Rich. II. st. 2, cap. 5, by which sheriffs of counties are empowered to arrest public preachers of heresy. This was properly an *ordinance*, and not a statute, but improperly inscribed in the parliament roll. This violation of the constitution awakened the ire of the Commons, who made a declaration, in which they recite the ordinance, and add, "that it never was assented to or granted by them; but that what had been proposed in this matter was without their concurrence, and they pray that the statute be annulled, for it was never their intent to bind themselves or their descendants to the bishops more than their ancestors had been bound in time past" (*Rot. Parl.*, 6 Rich. II). The 2 Hen. IV. cap. 15, crept into the statute-book in a similar way.

‡ Properly, these limitations on the authority of the ecclesiastical judge, in determining what is heresy, had reference only to the high commission court, since abolished (1 Will. & M. stat. 2, cap. 2): "yet seeing in the high commission there be [were] so many bishops and other divines, and learned men, it may serve for a good direction to others, especially to the diocesan, being a sole judge in so weighty a cause" (3 *Inst.* 40).

Law. (3.) *Reviling the ordinances of the Church*.—Whoever reviles the sacrament of the Lord's Supper may be punished by fine and imprisonment (1 Edw. VI. cap. 1; 1 Eliz. cap. 1). Any minister speaking in derogation of the Book of Common Prayer, shall, if unbeneficed, be imprisoned for one year for the first offence, and for life for the second; and, if beneficed, shall, for the first offence, be imprisoned six months, and forfeit a year's value of his benefice; for the second, be deprived and imprisoned one year; and for the third, be also deprived and imprisoned for life; while those who in plays, songs, or open words shall speak in derogation, depraving or despising of the said book, forcibly preventing its reading, or causing any other service to be used in its stead, shall forfeit for the first offence one hundred, and for the second, four hundred marks, and for the third, all his goods and chattels, and suffer imprisonment for life (1 Eliz. cap. 2). Respecting laws framed at the time when Rome and Geneva had combined against our liturgy, nothing need be added, except an expression of regret that they should have been suffered so long to remain unexecuted.

(4.) *Blasphemy against God* is an offence against our Blas-laws; for however well the Roman emperor said to phemy. the senate, "*Deorum injurias diis curæ*" (*Tac. Ann.* lib. i. s. 73), to deny the existence or insult the majesty of the Almighty is not only an offence to God and religion, but a crime against the laws, state and government * * * To say that religion is a cheat, is to dissolve all those obligations whereby the civil societies are preserved; and Christianity is part of the laws of England; and therefore to reproach Christianity is to speak in subversion of the law (*per Hale C. J.*, *R. v. Taylor*, 1 Vent. 293). Rightly, therefore, was it a part of the punishment of the defendant in this case, that he should stand twice in the pillory, with a paper on his head, on which was inscribed, "*For blasphemous words tending to the subversion of all government.*" The punishment of the pillory is, however, now abolished (1 Vict. cap. 23). Blasphemy is an offence by the statute (9 & 10 Will. III. cap. 32), and at common law. If the blasphemy be contained in a libel, the blasphemer may, on a second conviction, be banished for life from the king's dominions, for any term the court shall direct: if he do not, thirty days after sentence pronounced, go into banishment, the king is empowered, with the advice of his privy council, to send him to any place out of his dominions; and his return before the period of banishment have expired, subjects him to transportation for fourteen years (60 Geo. III. and 1 Geo. IV. cap. 8).

We have now to consider those offences which, being directed against individuals, their persons or their property, may properly be styled *private crimes*.

(1.) *Larceny, or theft*, is the felonious taking or carry-Larceny. ing away of the personal goods of another, and is either simple, which is where the taking is unaccompanied by additional atrocity, or mixed or compound, which includes the aggravation of taking from a house or the person. The punishments for larceny are various.

(2.) *Receiving stolen goods*, whether chattels, money, Receiving valuable security, or other property, is felony in all cases stolen where the stealing or taking the same is felony, and goods. punishable by transportation for not more than fourteen or less than seven years, or imprisonment for not more than three years, with or without hard labour, or with

Law.

or without solitary confinement, for the whole or any part of the time (7 & 8 Geo. IV. cap. 29, s. 4); and if a male, to be once, twice or thrice publicly or privately whipped, in addition to the imprisonment, if the court shall think fit (7 & 8 Geo. IV. cap. 29, s. 54).

Where the stealing, taking, obtaining, or converting of the goods amounted to a misdemeanor only, the receiving the same is also a misdemeanor, and punishable with transportation for seven years, or imprisonment for not more than two years; and if a male, to be once, twice, or thrice publicly or privately whipped (if the court shall so think fit), in addition to such imprisonment (7 & 8 Geo. IV. cap. 29, s. 55).

Embezzlement.

(3.) *Embezzlement* is the felonious appropriation by one, to his own use, of chattels, money, &c. whereof he is possessed for the use of another. Embezzlement by clerks or other servants is larceny, punishable by transportation for not more than fourteen or less than seven years, or by imprisonment, with or without hard labour, and with or without solitary confinement, for the whole or any part of the imprisonment (7 & 8 Geo. IV. cap. 29, s. 4), not exceeding three years; and if a male, to be once, twice or thrice publicly or privately whipped, in addition to the imprisonment, if the court shall think fit (7 & 8 Geo. IV. cap. 29, s. 47); embezzlement by bankers is punishable with transportation for not more than fourteen or less than seven years, or by fine or imprisonment, with or without hard labour, and with or without solitary confinement, for the whole or any part thereof (7 & 8 Geo. IV. cap. 29, s. 4), or both (7 & 8 Geo. IV. cap. 29, s. 49; see also 4 & 5 Vict. cap. 56).

Cheating.

(4.) *Cheating* is the obtaining from any one, under false pretences, any chattels, money or valuable security, with intent to cheat or defraud him of the same: it is punishable by transportation for seven years, or fine or imprisonment, with or without hard labour, and with or without solitary confinement, for the whole or any part of the time (7 & 8 Geo. IV. cap. 29, s. 4), or both.

Burglary.

(5.) *Burglary* is the breaking and entering the dwelling-house of another in the night time, that is from nine o'clock in the evening to six o'clock the next morning, with intent to commit a felony therein. The entering with intent to commit a felony, or, being there, the committing any felony, and in either case breaking out of the said dwelling-house in the night time, is also a burglary, which is punishable by death, if attended by violence; and if not, by transportation for life, or not less than ten years, or by imprisonment for not exceeding three years (7 Will. IV. and 1 Vict. cap. 86).

Any permanent building in which the renter or owner or his family dwell, or a set of chambers in an inn of court or college, or any out-houses communicating with the dwelling-house, either immediately or by means of a covered and enclosed passage, is held to be included in the term dwelling-house.

Arson.

(6.) *Arson* is the wilful and malicious setting fire to churches, chapels, houses, shops, warehouses, offices, outhouses, or buildings for trade or manufactures, and is, in the case of dwelling-houses, any person being therein, a felony punishable with death; if with intent to rob, it is punishable as felony, with transportation for life, or not less than fifteen years, or imprisonment not exceeding three years (7 Will. IV. and 1 Vict. cap. 87). Setting fire to a church, chapel, warehouse, &c., with intent to injure or defraud any person, is

felony, punishable with transportation for life, or not less than fifteen years, or with imprisonment not exceeding three years. To set fire to ships, with intent to commit murder, is the same offence, punishable with death; or if with intent to defraud owners or insurers, it is felony, punishable by transportation for life, or not more than fifteen years, or with imprisonment for not more than three years. Setting fire to agricultural produce or coal mines is a felony, punishable by transportation for life, or not less than fifteen years, or imprisonment not exceeding three years (7 Will. IV. and 1 Vict. cap. 89).

(7.) *Forgery* may be defined the unlawful making or alteration of a writing with intent to defraud another. It is a felony, punishable by transportation for life, or not less than seven years, or by imprisonment for not more than four nor less than two years (7 Will. IV. and 1 Vict. cap. 84).

(8.) *Murder* is thus defined by Lord Coke:—Where Murder. a person of sound memory and discretion unlawfully killeth any reasonable creature in being, and under the king's peace, with malice aforethought, either expressed or implied, this crime is felony, punishable by death; as also are injuries with intent to murder; but if the injury be not effected, the punishment is transportation for life, or fifteen years, or imprisonment for not more than three years (7 Will. IV. and 1 Vict. cap. 85).

(9.) *Manslaughter* is the unlawful and felonious killing of another without any malice expressed or implied. (1.) Involuntary, where a man doing an unlawful act, not amounting to felony, kills another. (2.) Voluntary, where upon a sudden quarrel two persons fight, and one of them kills the other, and where a man greatly provokes another by some personal violence, and the other immediately kills him. Manslaughter is felony, punishable by transportation for life, or for not less than seven years, or with imprisonment, with or without hard labour, not exceeding four years, or with fine (9 Geo. IV. cap. 31).

Rape.—For a definition of this crime, reference should be had to the Fourth Division of this work. It will be sufficient to observe, that by the 4 & 5 Vict. cap. 56, the punishment is diminished to transportation for life.

(10.) *Assault*, which is a forcible attempt to commit a crime against the person of another, is a misdemeanor, punishable by fine or imprisonment, or both.

Of private offences, these may be considered the chief.

PART II.

The Private Law of England.

In discussing the private law of England, we shall consider—(1) its several species, and their respective sources; (2) the extent of its authority; (3) its general doctrines; and (4) its procedure.

Sect. 1.—Species and Sources of English Private Law.

282. The private law of England may fitly be considered as composed of various systems of law, different in their origin, character, and, in some cases, obligation. It will be convenient to consider these systems separately, and as they are *general* or *particular* in their obligation. Of the first kind are the traditional or common law and the statute law; of the second, are the customary law and the laws ecclesiastical and maritime.*

* Although the division of the law of England into the written and unwritten law is authorized by the examples of Sir Matthew

Law.

The private law.

Its species.

Law.
The Com-
mon Law.

(I.) The common law, as it is emphatically called, is the traditional jurisprudence of the land, "the universal and immemorial usage throughout the country" (3 D. & E. 261), and is in England what the Roman civil law is in some countries—a law which speaks when other laws are silent; and, from the flexible and subtle qualities it possesses as a law of principle and reason, it supplies all the deficiencies of legislative foresight.*

Hale (*Hist. C. L.* ch. ii.), and Blackstone (1 *Comm.* 63), and sanctioned by the example of Justinian (*Inst.* lib. i. tit. ii. s. 3), and of the Greeks (*Dig.* I. 1, 6), it is not easy to apprehend the principle upon which it rests, seeing that all law in England is reduced to writing, and to be found in books. And besides, the circumstance of a law being in writing, is an accident, having no relation to the authority or nature of the law—to its historical character or scientific capabilities. Classifications of this kind have a direct tendency to impede the progress of the law as a science. Furthermore, the classification censured is one not recognised by the law itself; and it is a wholesome maxim—*Ubi lex non distinguitur neque vos distinguere debemus* (see Lord Stair's *Inst.* I. 13, 1).

* Of the origin of this system so little is known, that we must regret its earlier monuments have not been subjected to a more critical and intelligent examination than they have hitherto been. Indeed the history of English law has yet to be written; and it may be permitted to the author of this note, "much revolving these things," to advise the student that the historical information in both Blackstone and Mr. Reeve's learned work is to be received with great caution. Those works were written at a time when historical criticism was less profound in its researches, and less intellectual in its appreciation than it has been since.

A variety of opinions has been broached regarding the source of the common law. Fortescue believes that the common law of his time (and, with trifling exceptions, it is that of ours) was known to the Britons, and survived all the various revolutions which have since swept over the island, (*De Laud.* cap. xvii.); others ascribe it to the wisdom of the Danes, improved by few additions from the Saxon, and fewer from the Norman laws. (Mr. Hakewill's *Disc.* 1 Hearne's *Coll.* 6). Burke conceives the Conquest to be the important era in our legal history, (*Works*, vol. v. p. 595. 1813); while Sir William Temple (*Works*, vol. iii. p. 130-1) and Sir Matthew Hale (*Hist. C. L.* chap. v.) concur in the modern opinion, that Saxon laws and Saxon institutions long survived the defeat at Hastings, and that the Conquest did not disturb the civil polity of the country in any material degree (1 Ellis, *Introd. Domesd.* 196; Palgrave, *R. and P.* i. 53-5).

Perhaps, from a rigorous investigation into the grounds and reason of the common law, it might appear that for certain of its peculiarities it is indebted to the Roman law. This system of jurisprudence was largely studied in England in very early times. Claudius Caesar, we are told by Tacitus, sent over a colony to instruct the natives in Roman law (*Ann.* lib. xii. cap. 32). Papinian, assisted, it has been thought, by Paulus and Ulpian (Selden, *Diss. ad Fletam*, cap. iv. s. 3.), sat on the bench at York, (*Duck. De Usu Jur. Civ.* lib. ii. cap. viii. s. 66), as did the Emperor Severus and his son Caracalla (Drake, *Hist. York*, p. 10), one of their judgments, there delivered, being preserved in the Code (III. 6, 8); and at the same place, in the days of Alcuin, as he himself testifies, there was a famous Roman law school, (*Poema de Pontif. et Sanct. Ebor. Opera*, i. 256. Ratisb. 1777). St. Aldhelm, the learned bishop of Sherborne, in the seventh century, is supposed to have compiled a treatise on Roman law (Palgrave, *R. and P.* i. 648). He alludes to the ardour with which that system was studied in England in his times, (*St. Aldelmi Epist.* 2 Wharton *Ang. Sac.* 6). The results of these studies are apparent in what we call the Anglo-Saxon laws (Savigny, *Geschichte*, b. 2, kap. x.); and the father of English history informs us that Ethelbert, who died in 613, established a system of laws in imitation of those of Rome (Beda, *Hist. Ecc.* lib. ii. cap. 5). Our early law writers Bracton and Fleta, quote the Roman law repeatedly (2 Burr. 1079); and the proem to Glanville's famous treatise is almost a paraphrase of that to the *Institutes*. The great Vacarius expounded Roman law at Oxford in 1129 (Wenck, *Magister Vacarius*, 65), as shortly afterwards did Francesco Accorso or Accursius, the younger of the two famous Bolognese glossators of that name (Tiraboschi, *Dell. Lit. Ital.* tom. iv. lib. ii. s. 21. Milan, 1823); and our great bishop Grosseteste wrote a treatise in its favour. (Selden, *Diss. ad Fletam*, cap. ix. p. 538, 1685). Theobald, the Norman archbishop of Canterbury, founded at Oxford a professorship of civil law, and used to

The sources of the common law are twofold—judicial opinions, which are the recorded opinions of the judges, and certain text writers.

Judicial opinions are recorded—

(1.) In what are styled reports, which are histories of the several cases, containing a summary of the proceedings, of the arguments of counsel, and the decisions of the judge, with his reasons, as stated by him. From Edward II. to Henry VIII. we have a series of these reports, taken by the prothonotaries, or chief scribes, of the court, authorized by the judges, and published at the expense of the crown (1 *Comm.* 71). They have been subsequently the work of "private and contemporary hands" (*Ib.* 72); and their authority depends upon the sense the court entertains of their fidelity. A manuscript report of a case is also authority (Willes, 239), although new to the court or some of the parties, or both (1 P. W. 680).

(2.) In what is styled the record of the court (*Co. Records. Litt.* 24 a; 1 *Ca. temp. Hard.* 362-74), which is "a memorial or remembrance, in rolls of parchment, of proceedings and acts of a court of justice which hath power

retain in his house, according to Peter of Blois, his chaplain (*Epist.* vi. 3. Paris, 1519), several learned persons, famous for their knowledge of law, who spent the hours between prayers and dinner in lecturing, disputing, and debating causes. Very nearly, in truth, was fulfilled the prediction of Juvenal—

Gallia causidicos docuit facunda Britannos.

In early times the clergy were, in England, both civil and common lawyers, and *nullus clericus nisi causidicus* became a proverb. "The person most skilled in the ancient laws and customs of the land," in the time of the Conqueror, was Egelric, bishop of Chichester (*Spic. ad Eadm.* p. 197); and in the days of his successor flourished one Ranulph, "a clerk," or priest, whom William Malmesbury (123) styles "*invictus causidicus*." The monks of Croyland (Ingulph. 36) and of Spalding (Nicholls, *Literary Anec.* vi. 38) were distinguished as lawyers; and when we remember the attachment of the clergy to the civil law, we can hardly doubt that that system was not without its influence in giving at least form and coherency to the doctrines of our law. On this subject, see 12 *Mod.* 482, and some observations by Sir William Jones, in his *Life* by Lord Teignmouth, vol. ii. p. 168.

Our knowledge of Anglo-Saxon jurisprudence is in reality less extensive and precise than is generally believed; for the collections which profess to contain the Anglo-Saxon laws are composed only of the records of decisions, operating as precedents, or the scanty enactments of the *witenagemote* (Thorpe, *Anc. Laws and Inst. of Eng.* pref. iii.). It must also be remembered that Anglo-Saxon England cannot properly be considered as one state, governed by one law; it was a congeries of states, each state having its own laws.

These laws, however, were similar in their character; however they differed in the peculiarities of their provisions: and in this character, without doubt, shares the common law of England, which seems instinct with the free spirit of Teutonic antiquity, and in its genius wholly Anglo-Saxon. It was refined and subtilized by the acute jurists of Normandy, *quibus nulla gens magis litigiosa atque in controversiis machinandis et proferendis fallacior reperiri potest* (Honorius, *Praxis Prud.* Pol. 212. Frankf. 1616); and by its application to new but analogous cases—an analogy extending from age to age—an immense fabric of jurisprudence was at length built, on somewhat rude foundations (Mackintosh, 1 *Hist. Eng.* 274). It has been said that the common law and statute law flow originally from the same fountain—the legislature; the statute law being the will of the legislature remaining on record in writing; the common law nothing else but statutes anciently written, but which have been worn out by time (*per* Wilmot C. J., *Collins v. Blantern*, 2 Wils. 348). Whatever may be the legal value of this theory, it has none in history, as it is not only not true, but the precise converse of what is true; the greater number of the early statutes having been, and often professing to be, only declarations of the common law. Without doubt, Parliament was, in its origin, a court of justice, and derived its modern power of making, from its ancient power of declaring, law. It was for "the maintenance and execution," and not the creation, "of the laws," that Parliament was to assemble every year (14 Edw. III. cap. 14; 36 Edw. III. cap. 10).

Law.
Sources.

Law. to hold plea according to the course of the common law" (*Co. Litt.* 260 a). With the exception, in some cases, of the register of decrees in the Court of Chancery (*Lane v. Williams*, 2 Vern. 277-92), it usually contains only the judgment, and not the reasons on which it is founded (3 *Rep.* pref. iii.),—which makes records of inferior value to the reports, for "our bookcases are the best proof of what the law actually is" (*Co. Litt.* 254 a).

Judicial opinions are of two kinds, and may be distinguished as (1) *decisions*, or (2) *dicta*.

Judicial decisions.

(1.) *Judicial decisions*.—It is to be understood that the appropriate duty of the judge is to decide the particular case submitted to him. He does not sit to determine general questions of law; and, despite the "great deal of learning and judgment" which distinguished the brief "interlocutions between the judge and the pleaders", so remarkable in the reign of Edward I.* (*Hale, Hist. C. L.* chap. vii.), it has been thought more prudent in the judge to confine himself to the question before him (2 Durnf. & E. 73). Sometimes a case may involve two or more questions, and the determination of one, and that of the least general interest, may decide the case; and courts have refused to go beyond the latter, or have decided upon the special circumstances, without entertaining the general question at all (8 Taunton, 55)—a practice which is not invariable (3 Durnf. & E.

697), nor deserves to be so. A case decided† becomes a precedent, and governs similar cases for the future; and this in order to secure fixity in the law (2 C. & M. 64), uniformity in the decisions of the courts (6 B. & C. 533), and to obviate the inconvenience resulting from upsetting a decision on the strength of which transactions may have occurred (6 Bing. 24). The value of a precedent is enhanced by its having been long held law (*Jacob*, 461), supported by many decisions (3 Atk. 763), or followed in practice (2 B. & Ad. 943). But it is sometimes overruled, when contrary to reason or common experience (*Willes*, 182; 11 East, 570), or, in cases relating to the construction of deeds, to the rules of language and criticism (1 B. & Ald. 330), or when founded on a mistake of the law (7 B. & C. 476), or even when the attention of the court has not been directed to a strong authority on the point (2 M. & S. 277). These objections do not always weigh with the court, and rarely in reference to a case that has been considered to have settled the law upon any point (2 Bing. 451). "In all usages

and precedents, the times [are to] be considered where—in they first began, which, if they were weak or ignorant, it derogateth from the authority of the usage, and leaveth it for suspect" (*Bacon, Adv. of Learning* book ii.).

A decision operates on an undecided case—

First, by furnishing a rule applicable to the case Rule. a rule being a point decided or laid down by competent authority, and is in the nature of a maxim; or,

Secondly, the undecided case may be within the Reason of reason of the decision; wherefore it has been said, a case. "that the reason of a resolution is more to be considered than the resolution itself" (*per Holt C. J.*, 12 Mod. 294); but still a judge is not bound to give the reasons of his decision (*Gregory v. Molesworth*, 3 Atk. 626).

Often the judges have been disposed to overrule a decision which they considered objectionable; and, in objectionable precedents. forbearing to do so, have often prevented other cases from coming under its influence, by instituting between them distinctions of circumstances (3 Atk. 68; 7 B. & C. 195-6). Such distinctions, unless for such a purpose, or unless previously recognised and established (*Harwood v. Oglander*, 8 Ves. 125), the courts usually discountenance, and sometimes positively refuse to acknowledge (2 Atk. 41-314).

In deciding a new case,* "to which there is nothing New cases. parallel in the books" (1 Lord Raym. 692), the judge is sometimes influenced by considerations of "reason and justice" (3 Bing. 266), or reasons from the analogy of other cases, if he can (*per Best C. J.*, 3 Bing. 265), remote as the analogy may be; or perhaps he rests his decision on certain rules of construction of deeds, on general practice, on the books of entries and the returns of writs, and on convenience, if the new case be one of practice (*Ram, Science of Legal Judgment*, 155).

Where two decisions of equal value, in relation to the Anti-nomie. courts from which they emanate, are inconsistent with each other, as a rule, the second usually prevails when a fresh case has to be decided (4 B. & C. 589); but this rule is not invariable (9 East, 157). A series of recent uniform decisions prevails over decisions of prior date (1 Taunton, 234); but where there is no uniformity in the decisions, and an election has to be made amongst them, it would appear that the judge would be controlled in that election by considerations of reason and justice (6 Durnf. & E. 655; 9 Bing. 203).

(2.) *Judicial dicta* are opinions expressed by judges Judicial dicta. unnecessarily, as not containing the grounds of the judgment pronounced on the case before the court. They have a certain value, but never that of a judicial decision (5 M. & S. 185; 1 Burr. 153; 2 East, 17),

* Speaking of the year-books, Roger North says, "it is obvious what deference ought to be had to them, more than to the modern reports; for, passing by their short and material rendering the sense of the pleaders and of the court, it must be observed, that the whole cause, as well the special pleadings as the debates of the law thereupon, were transacted or alleged at the bar; and the prothonotaries, *ex officio*, afterwards made up the records in Latin; and the court often condescended to discourse with the serjeants about the discretion of their pleas and the consequences with respect to their clients. And the court did all they could to prevent errors and oversights" (*Life of Lord Keeper North*, vol. i. p. 29, 1826). In *Seymour v. Barker* (2 Taunton, 201), the judges appeared to discountenance a reference to the year-books for an authority; but *Vyryan v. Arthur* (1 B. & C. 410) was decided chiefly on the authority of a case in those reports.

† The value of a decision depends, in some measure, on the court in which it is pronounced. Thus a judgment of the House of Lords, the highest appellate jurisdiction, is of greater value than one of the Court of King's Bench, sitting *in banco*, which is itself preferable to a mere ruling of a judge at *Nisi Prius*. The value, indeed, of a *nisi prius* ruling is very low (2 Bing. 90). Unquestionably the character of a judge enhances the value of his decisions.

* "The case is in some sense new, as many others are, which continually occur; but we have no right to consider it, because it is new, as one for which the law has not provided at all, and because it has not yet been decided, to decide it for ourselves, according to our own judgment of what is just and expedient. Our common law system consists in applying to new combinations of circumstances those rules of law which we derive from legal principles and judicial precedents; and for the sake of attaining uniformity, consistency, and certainty, we must apply those rules where they are not plainly unreasonable and inconvenient, to all cases which arise; and we are not at liberty to reject them, and to abandon all analogy to them, in those to which they have not yet been judicially applied, because we think that the rules are not as convenient and reasonable as we ourselves could have devised" (*per Parke J.*, *Mirehouse v. Bishop of Lincoln*, 3 Bing. 515). "*Le juge qui refusera de juger, sous prétexte du silence, de l'obscurité, ou l'insuffisance de la loi, pourra être poursuivi comme coupable de déni de justice*" (*Tit. Prélim. de la Pub. des Lois; Premier Proj. de Code Civil*).

Law. not being confined to the particular circumstances in reference to which they were uttered (*per* Lord Kenyon, 7 Durnf. & E. 287); but the degree of their value depends on a variety of circumstances.

Text-books. Certain *text-books*, written by eminent lawyers, have also an authority* in Westminster Hall, where they may be cited in proof of the law (*Co. Litt.* 11 a). Amongst these, the writings of Sir Edward Coke hold a deserved pre-eminence; and an observation, undoubtedly just, made in reference to these, will explain the value of our text-books in evidencing the law. In reference to a particular position of Coke's, Lord Wynford observed, that "Lord Coke had no authority for what he states; but I am afraid," he adds "that we should get rid of a great deal of what is considered law in Westminster Hall, if what Lord Coke says without authority is not law. He was one of the most eminent lawyers that ever presided as a judge in any court of justice, and what is said by such a person is good evidence of what the law is" (2 Bing. 296-7). In reference to a position in the *Digest* of Chief Baron Comyns, the same learned judge remarks of the author, "this he lays down on his own authority, without referring to any case, and I am warranted in saying we cannot have a better authority than this learned writer" (5 Bing. 387-8). Similar language was used by Lord Kenyon (3 Durnf. & East, 64-631).

Statute aw. Public Acts. (II.) The *statute law* consists of the statutes, or acts of parliament, which are written laws made by Parliament. Of these there are two kinds—(1.) Public Acts, which are those that relate to the whole kingdom—to the king, queen, or heir apparent; all great officers; all officers of any kind, as all sheriffs, all lords of manors, the whole spirituality, and to trade in general, and this though in relation to a special or particular thing. Of these the courts are bound *ex officio* to take notice. (2.) Private Acts concern only a particular species, thing, or person, or relate only to certain places. These Acts the courts are not bound to know, and they must formally be stated to them in all controversies, by the parties who rely on such Acts. A private statute is said not to bind or include strangers in interest to its provisions; and it has been held, that though every man be so far a party to such a statute as not to gainsay it, yet he is not so far a party as to give up his interest (*per* Hale C. B., *Lucy v. Levington*, 1 Vent. 175).

Nature of Acts. According to their objects, statutes may introduce a new law, or declare (declaratory statutes) the old, or supply its defects (remedial statutes), and may affix penalties for transgression of their provisions (penal statutes). A statute can be repealed or altered only by a statute.

* Mr. Ram (*Science of Leg. Judg.* 82) very properly applies to the authority of these works the observations which Wilmot J. has made in reference to the authority of courts. He considers "authority" to have the same signification which it bears in Livy's character of Evander (*R. v. Almon*, *Wilmot's Notes*, 256 *et seq.*) *Evander tum ea auctoritate magis, quam imperio regebat loca* (Liv. i. 7). "A learned writer," says Harrington, "may have authority, though he has no power" (*Oceana*, *Prel. Works*, p. 39). In our laws holds the maxim, *che un opinione di Carpsivio, un uso antico accenato da Claro, un tormento con iracunda compiacenza suggerito da Furinaccio, sieno le leggi a cui con sicurezza ubbidiscono coloro che tremando dovrebbero reggere le vite e le fortune degli uomini* (Beccaria, *Dei Delitti e delle Pene*, pref. p. 6. Vienna, 1798). Something similar was the reputation enjoyed by Pothier, in France: *Les ouvrages de Pothier n'ont pas été reçus comme lois; mais ils ont obtenu un honneur semblable: car plus des trois quarts du Code Civil ont été littéralement extraits de ses traités* (Dupin, *Dissert. sur la Vie, &c. de Pothier*, p. cxiv.).

Law. In construing statutes, the great principle is to ascertain and give effect to the intentions of the legislature.

The principal rules of construction are as follows:—

(1.) Statutes are to be construed according to their intent, which is to be collected, first, from the words employed, and, when the sense of these is ambiguous, from the occasion and necessity of the statute, provided that this construction is not inconsistent with their language. The intent, when it can be learnt with certainty, will always prevail over the literal meaning of the terms (11 Rep. 73).

(2.) They are to be construed one part with another, so that the statute may operate as a whole—*ut res magis valeat quam pereat*.

(3.) When its language be of doubtful import, a statute is to be construed in reference to others, *in pari materia*, relating to the same subject (*Rex v. Loxdale*, 1 Burr. 447).

(4.) Remedial statutes are to be construed liberally,* so as to meet the end in view, and to prevent a failure of the remedy.

(5.) Penal statutes (with the exception of those against frauds) are to be construed strictly, as are—

(6.) Statutes taking away trial by jury, and unfriendly to the liberties of the subject, and

(7.) Statutes imposing charges upon the subject, and

(8.) Statutes conferring powers derogatory to the rights of private property, and

(9.) Private acts of parliament, conferring upon individuals or a company new and extraordinary powers of a special kind, affecting private property or exempting it from public burdens, and

(10.) Statutes creating new jurisdictions; for the superior courts shall not be ousted of their jurisdiction but by express words or by necessary implication.

(11.) Statutes are not to be construed so as to admit of absurd consequences.†

Our statutes commence with the reign of Henry III., and those passed down to the end of the reign of Edward II., with some *incerti temporis*, are styled *vetera statuta*; all subsequent in date are called *nova statuta*. The earliest statutes are in Latin, the 51 Henry III. being the first in French. After this time, Latin and French were indiscriminately used, up to the 33 Hen. VI., when was passed the last statute wholly in Latin. The publication of the statutes in English is supposed to have begun at the commencement of the reign of Henry VII., after the fourth year of whose reign English has been, without doubt, the language uniformly used.

In the construction‡ of statutes, our judges in former

* To interpret a statute *strictly*, is to adhere precisely to the words or letter of the law, which includes, of course, fewer particulars than a freer construction. To interpret it *liberally*, largely, and comprehensively, is to carry the meaning of the lawgiver into more complete effect than a confined interpretation would allow (*Rutherford, Inst. Nat. Law*, book i. chap. vii. s. 7-11).

† There is another rule relating to the construction of statutes, which, as containing a general principle, is worth detailing at length: "When an act of parliament doth alter the service, tenure of the land, or other thing in prejudice of the land, or of the custom of the manor, or in prejudice of the tenant, then the general words of such act of parliament shall not extend to copyholds; but when an act of parliament is generally made for the good of the weal public, and no prejudice can accrue by reason of alteration of any interest, service, tenure, or custom of the manor, then many times copyholds and customary estates are within the general provision of such Acts" (*Heydon's case*, 3 Rep. 8).

‡ "We cannot say of the legislature," Lord Tenterden once observed, "that it is *inops consilii*, but we may say that it is *magnus*."

times assumed an authority which made it difficult to determine the boundaries of the legislative and judicial powers. They did not seem to have coincided with the maxim of Lord Bacon, "*Optima est lex quæ minimum relinquit arbitrio judicis; optimus judex qui minimum sibi*" (*De Aug. Scient.* lib. viii. cap. iii. aph. 46).

inter opes inops" (*Carr v. Stephens*, 9 B. & C. 758). An opinion of this kind appears to have prevailed amongst the judges both in early and comparatively recent times, although few have avowed so broadly, as did Chief Baron Hobart, their belief in the "liberty and authority that judges have over laws, especially over statute laws, according to reason and best convenience, to mould them to the best and truest use" (*Lord Sheffield v. Ratcliffe*, Hobart 347). Acting, however, on his principles, judges have defeated the palpably expressed intentions of the legislature, sometimes by a dexterous invention of fictions, sometimes by a strict, and sometimes by a lax construction of the statute. The history of estates tail illustrates the point. The nature of the estate is explained subsequently (p. 828, *post*), where it is clearly shown that the intention of the legislature, in making the law to which estates tail owe their existence, was to preserve, in the line of descent indicated by the donor, all lands entailed: but the judges very early lent their aid to the tenant in tail anxious to alienate. Straining the language of the Statute of Gloucester (6 Edw. I. cap. 3), they held, in the first place, that a tenant in tail could safely alien and defeat the rights of his issue to whom it was after-limited, provided an estate in fee simple, of equal value, should devolve upon his heir. This heir was considered to have thus received a recompence (*Octavian Lombard's case*, Y. B. 44 Edw. III). To evade this, Richel, a judge in the reign of Richard II., invented a form of limitation, which he fondly hoped all the *astutia* of his brethren would not enable them to defeat; but it was set aside as void (*Litt. lib. iii. s. 720*); as also was a settlement by Thirning, the chief justice (21 Hen. VI., H. T. 33 b). The next step was to apply to estates tail the fiction of common recoveries, by which the operation of the statutes of mortmain had been already successfully eluded. A common recovery was in form an action at law, and in reality a mode of conveyance. It may be explained thus. The party purchasing pretended to be entitled to the lands in question, sued out his writ against the seller, who came into court, and instead of defending his title, called upon some person, who it was feigned had originally warranted the title to him, to appear and defend the title attacked, or to give him land of equal value. On this the person (usually named the vouchee) appeared to the action, and the seller (demandant) intreated the permission of the court for a private conference with the grantee, which was never denied. Shortly after this the demandant returned into court, while the vouchee disappeared; on which the court, presuming the title of the demandant good, immediately gave judgment in his favour. (*Pigott's Treatise of Common Recoveries*). This was the form latterly adopted, and of its validity to bar the issue in tail no doubt seems to have been entertained; but in the reigns of Henry IV. and V. it seems to have been doubtful how far the default of the tenant (there being no vouchee) would avail. At length it was decided that such a recovery was good against the issue (3 Hen. VI. 556). The celebrated Taltarem's case (12 Edw. IV., E. T. 2 b) is said to have been "brought on the stage" by Edward IV., in order to obtain, as was actually done, a solemn decision affirming the efficacy of common recoveries. The apparent object of the king was to destroy the power of the overgrown feudatories, whose vast possessions and wealth threatened the stability of the throne. Thus did the *astutia* of the judges most effectually defeat the operation of the famous statute of *De Donis*, the repeal of which had been frequently sought without effect from the legislature (6 Rep. 40 b).

The result has been, that it is now law that no tenant in tail can, by any condition, limitation, custom, recognizance, statute, or covenant whatever, be restrained from aliening (*see the cases collected by Mr. Butler; Co. Litt. 379 b. n. 1*).

A particular form of actions, known as *real actions*—now, with certain exceptions, abolished by act of parliament (3 & 4 Will. IV. cap. 27)—were previously practically repealed by the decisions of the judges. If, from the ignorance or negligence of counsel or attorney, there was any slip in the proceedings, the court would not allow of any amendment, and thus assumed in fact a power "indirectly to defeat a remedy tolerated by the legislature" (*Real Prop. Commissioners' First Report*, p. 42).

It has been said of the Court of Chancery, that its acts have been rather legislative than judicial (*Humphreys, Observ. Law Real Prop.* p. 94); and we certainly find that it has not evinced what Beccaria styles *l'errante instabilità delle interpretazioni*, but has boldly contravened the obvious and expressed will of the

The operation of a statute as law commences from the day the royal assent is given, which is indorsed on the Act by the clerk of the Parliament (33 Geo. III. cap. 13); but its operation, by a clause in its body, may be suspended for a certain period; or the statute may have a retrospective operation, if it contain an express provision to that effect (*Churchill v. Crease*, 5 Bing. 178; and *see Ib.* 492).*

Of the laws local and particular in their operation are—(I.) The customary law, composed of certain immemorial and local customs. Amongst such are gavelkind,† borough English,‡ and the customs belonging to various manors.§ For a custom to be good in law, it must have existed "so long that the memory of man knoweth not to the contrary," must have been continued, must have been acquiesced in, must be reasonable and certain, compulsory, and not left to every man's option to obey or not; and, lastly, customs must be consistent with each other.

(II.) The civil and canon laws operate in England, so far as they have been admitted and received by immemorial usage and custom, in some particular cases and some particular courts, or so far as they may have been introduced by act of parliament (*Hale, Hist. C. L.* ch. ii.).

As to the canon law. The 25 Hen. VIII. cap. 19, confirms all canons, constitutions, ordinances, and

legislature. The Statute of Frauds (29 Car. II. cap. 3) required certain contracts to be reduced to writing. Still a court of equity will enforce a verbal contract of the description, on the alleged ground that it had been agreed that its terms should be reduced to writing (2 Cha. Ca. 135). A defendant was required by the court to confess or deny, in his answer on the oath, the fact of having entered into such a contract, in order, in the latter case, of rendering his answer equivalent to writing (1 Dick. 39). An agreement partly performed, courts of equity held not within the statute (2 Sch. & Lef. 5), whose intentions they again defeated, by giving effect to a verbal agreement for a mortgage, accompanied by a deposit of the title-deeds. These deeds were held a security for subsequent advances, if the court were satisfied, and verbal evidence was sufficient, that these advances were made on the terms of being so secured. This fact they would ascertain themselves, if the parties differed in respect of it (17 Ves. 230; 14 Ves. 60).

That great chancellor Lord Nottingham, in reference to some cases which had been cited, declared, that "he would alter the law upon that point" (*Freeman v. Goodham*, Ch. Rep. 295); but Lord Talbot, when this declaration was quoted, remarked, "I do not see how anything less than an act of parliament can alter the law" (*Heard v. Stamford*, 3 P. W. 411).

Other instances of the judges assuming to themselves legislative power might be mentioned. One is too remarkable to be omitted, relating to the conclusion of the oath taken in judicial proceedings. In the reign of Edward I. the oath concluded, "*Si Dieu m'aide et les Seintz*" (*Stat. Exon.* 14 Edw. I.); and, as late as 1553, the oath administered in the House of Lords concluded, "So help me God, and all Saints." The alteration ought to have been made by the legislature (*see Alderson B., Frost's case*, 2 Moody, C. C. 150). The following "instances of a wide and spirited departure from the express language of the statutes" are cited by Sir Fortunatus Dwaris (*On Statutes*, 708):—5 Eliz. cap. 4, s. 41: *R. v. St. Nicholas in Ipswich*, Burr. S. C. 91;—3 Will. & M. cap. 11: *Anthony v. Cardigan*, 2 Bott. 172;—8 & 9 Will. III. cap. 30: *R. v. Clayhydon*, 4 T. R. 100; *R. v. St. Mary, Lambeth*, 8 R. 236; *R. v. King's Pyon*, 4 East, 351.

*The principle is, that "*Nova constitutio futuris formam debet imponere, non præteritis*," a principle not peculiar to our law. *En général, les lois n'ont point d'effet rétroactif. Le principe est incontestable* (*Disc. Prélim. du Prem. Proj. du Code Civil*). *La loi ne dispose que pour l'avenir; elle n'a point d'effet rétroactif* (Art. 2, tit. Prélim. de la Pub. des Lois. *See also* *Gilmore v. Shuter*, 2 Lev. 227; *Att. Gen. v. Lloyd*, 3 Atk. 541; *Ib. v. Andrews*, 1 Ves. sen. 225).

synodals provincial, not repugnant to the law or the royal prerogative, which had been previously made "by the clergy of this realm;" and all "other ecclesiastical laws or jurisdictions spiritual" are also confirmed by the 35 Hen. VIII. cap. 16. A complete review of the canon law being purposed at this time, and which never took place, these laws were intended only to subsist temporarily. The two Acts were repealed, the first in terms, the second impliedly, by the 1 Ph. & M. cap. 8, which was itself in terms repealed, as far as it repeals the first Act, which is thereby revived. The second Act has never been revived, and therefore it would seem that no part of the canon law, except such as emanated from "the clergy of this realm," has, by law, any operation here; a fact which appears hitherto to have escaped the consideration of the learned judges of both the common law and ecclesiastical courts (*see Edes v. the Bishop of Oxford, Vaughan, 21-4*).

Civil law.

A portion of the civil law is received in our ecclesiastical and admiralty courts, and, in some instances, in the courts of law, especially in those instances in which the ecclesiastical courts follow it; then, in order that there may be an uniformity of judgments in the different courts, the temporal courts follow it also. In cases of legacies given out of personal estate, the temporal courts often follow the civil law (1 P. W. 1; 3 Atk. 346). From the civil law "we borrow all or at least the greatest part of our rules upon legacies" (*per Sir W. Grant, M.R., 6 Ves. 243*). The civil law maxim, *ex nudo pacto non oritur actio* (Cod. II. 2, 3, 10), is adopted by our law (3 Burr. 1670-1); and sometimes we follow the rules it lays down respecting the application of indefinite payments made by a debtor to his creditor.

Sect. 2.—The Authority of the Private Law of England.

Operation of law of England:

283. In considering the authority of the private law of England, we will consider the extent of its operation, first, as to *places*, and, secondly, as to *persons*.

in England.

I. First, then, it operates throughout that part of the united kingdom of Great Britain and Ireland called England, within which is included the town of Berwick upon Tweed* (20 Geo. II. cap. 42), through Wales (27 Hen. VIII. cap. 26; 34 & 35 Hen. VIII. cap. 26), and through Ireland—first, as to the common law (*Co. Litt. 141*); secondly, as to the whole law existing in the tenth year of the reign of Henry VII. (Irish Stat. 10 Hen. VII. cap. 22); thirdly, as to all laws passed since the Union (39 & 40 Geo. III. cap. 67), unless Ireland be excluded expressly or by implication. The 6 Geo. I. cap. 5, declared that the English parliament could bind the Irish people by its laws; but this Act was repealed by the 22 Geo. III. cap. 53; and the exclusive right of the Irish parliament to legislate for Ireland was declared by the 23 Geo. III. cap. 28. It would appear, therefore, that statutes of the English parliament passed between the 10th Hen. VII. and the 22 Geo. III. have no operation in Ireland.†

* On the high seas, beyond low-water mark, a portion of which is within the realm of England, the common law has no operation, that is within the High Admiral's jurisdiction; but it does operate between high and low-water mark when the shore is dry (*Finch, Law, 77*).

† Before the Union, Ireland was for many purposes considered as a foreign country. It was beyond the seas, within the meaning of

Except as respects certain fiscal regulations, the English private law does not extend to the islands of Man, Guernsey, Jersey, Sark, Alderney, and their appendages, nor to Scotland (5 Ann. cap. 8).

As to the colonies, a distinction must be taken between such as were settled by our subjects, and such as were ceded to or conquered by us. In colonies of the first kind (of which Australia is a familiar example), the colonists are understood to carry to their new abode, first, the common law of England, and secondly, such statutes passed previous to the settlement of the colony as are applicable to their own circumstances; so that laws relating to bankruptcy, the maintenance of the poor, police, tithes, &c., have in such a colony no operation. Statutes passed subsequent to the settlement do not operate in the colony, unless it be named or virtually included therein; for the general run of laws enacted by the superior state are supposed to be calculated for its own internal government, and not to extend to its remote dependencies. But these are bound by statutes relating to navigation, trade, revenue, and shipping, although not specially named (2 P. W. 75). The laws of a conquered colony continue until altered by the conqueror, that is, in England, the crown (*per Lord Mansfield, Wall v. Campbell, Cowper, 204*).

Our laws, however, like those of every other country, have, by the comity of nations, an extra-territorial operation. Generally speaking, such of them as define the *status* or civil condition and capacity of our subjects travel with them wherever they go, and their obligation it is not possible to remove. Such are laws which may properly be styled *personal*, determining whether a man be legitimate or illegitimate, under or of full age, insane, an idiot, a bankrupt, married or divorced, and the like. As to laws governing the succession to an intestate's property, it is doubtful whether our law operates extra-territorially; but it is clear, if an Englishman changes his domicile to Scotland, and dying intestate, that the law of Scotland would control the disposition of his personal estate (*Curling v. Thornton, 2 Addams, 17*). The incidents to these qualities may depend on the law of the country to which he goes; but, as qualities, they will, by the general comity of nations, be generally recognised by the foreign tribunals. These will also recognise our laws respecting the validity of contracts, unless indeed inconsistent with the rights and interests of the citizens of their state, or with its public policy and fundamental laws. The king, his ambassadors (but not consuls), fleets, and armies, while residing in, or travelling to, a friendly state, are still under the entire dominion of our laws (3 Rob. 13-27; 4 *Ib.* 26).

Our law acknowledges the validity of contracts entered into in a foreign country, and there intended to be performed, if they are valid according to the law of that country (*The King of Spain v. Machado, 4 Russ. 225; Potter v. Brown, 5 East, 130*); for, if an obligation is valid where it is professed to originate, it is valid every where else. Not only does our law recognise a marriage esteemed valid where it was

the 21 Jac. I. cap. 16, and with respect to the exceptions of disabilities under the statute relating to fines (*see 18 Edw. I., Mod. lev. Fin.*, compared with 4 Hen. VII. cap. 24), and the old rule regarding illegitimacy from impossibility of access (*Jenk. Cent. 10*). And since the Union, Ireland is in some respects considered as a foreign country (*Battersby v. Kirk, 3 Scott, 11; Whyte v. Rose, 11 Law J. (N. S.) Exch. 457*).

Law.

contracted (*Lacon v. Higgins*, 1 Dow. & Ry. 38), but it does not generally recognise marriages celebrated abroad unless there considered valid (*Butler v. Freeman*, Ambl. 303; but see *Ruding v. Smith*, 2 Hagg. 385). A court of equity, with that liberality which is its proper characteristic, has so far taken cognizance of a foreign law as to have forborne to compel a husband to make a settlement upon his wife entitled to a share of his personal property under the Statute of Distributions, on its being proved that the wife was resident in Prussia, and that, by the law there, a moiety of the husband's effects must have come to her (*Sawyer v. Shute*, 1 Ans. 63; and see also 3 Ves. 323).

Process on foreign contracts.

But although the authority of the law of England does not extend to determine the validity of foreign contracts, still if their enforcement is craved of our courts, its authority does extend to the definition of the forms and means by which the enforcement shall be induced. The process must be according to our law: so a foreigner may be here arrested for a debt, or in equity upon a writ of *ne exeat regno*, although, by the law of the place where the debt was contracted, he could not have been imprisoned (*De la Vega v. Vianna*, 1 B. & Ad. 284; *Flack v. Holm*, 1 Jac. & W. 405); a doctrine which has been carried so far as to justify proceedings against a person as partner, because he was jointly concerned in trade with another in Holland, although partnership does not there arise from such a community of business (*Shaw v. Harvey*, Mood. & M. 526). Further, as to the time of commencing proceedings on foreign contracts, the English courts will have regard, not to the *lex loci*, but to the English statutes of limitation (*The British Linen Company v. Drummond*, 10 B. & C. 903).

Interpretation of deeds executed here.

Our law, also, it would appear, claims to determine the interpretation and effect of every deed or will executed here (*Trotter v. Trotter*, 4 Bligh (N. S.), 502; *Anstruther v. Chalmers*, 2 Sim. 1); although it is doubtful whether, in cases of devises of lands, the tribunals of the country where the lands lay would accord them this jurisdiction (*Vattel*, liv. ii. ch. viii. s. 3; 1 Wheaton, *Elem.* 136).

Foreign revenue laws, and laws opposed to our policy or the law of nature.

"No country ever takes notice of the revenue laws of another (*per Lord Mansfield*, *Holman v. Johnson*, Cowper, 343; and see further 2 Peake, 81, and 1 Esp. 389); nor will ours admit the operation within its limits of any foreign municipal law, contrary either to its public policy or to the law of nature. A slave, a native of East Florida, where the law countenances slavery, escaped to a British man of war; and it was held, that coming under the protection of our colours, he relieved himself from the operation of a local law of East Florida, which was contrary to the natural law of eternal justice (*Forbes v. Cochrane*, 2 B. & C. 448; and see the case of Somerset the negro, and Hargrave's note, *Co. Litt.* 79 b).

II. The persons subject to the authority of the English private law are now to be considered; and first, as they are subjects or aliens.

Natural-born subjects.

(1.) Natural-born subjects are such as are born within the dominions of the crown of England, or, as it is said, within the allegiance of the king. This in-

* It must be observed, with reference to the proof of foreign law, that it must be established. The court cannot take notice of it judicially, (1 P. W. 431; 3 Ves. & B. 99). As to how this proof is to be made, at law, see *Lacon v. Higgins* (*ut sup. cit.*); General Picton's case, 30 St. Tr. 514; 1 Dow. & Ry. 42, n. a; in equity see *Hill v. Reardon*, Jacob, 90; *Flack v. Holm* (*ut sup. cit.*).

cludes the children of our ambassadors, wherever born, and children whose fathers (or grandfathers by the father's side) were born within the allegiance of the king, unless their ancestors were attainted or banished for high treason, or, at the birth of such children, were in the service of a hostile foreign power. These are properly subject to all the laws of England, entitled to the rights it confers, subject to the disabilities it contains—a principle subject to certain important modifications. It is not in the power of any private subject to shake off his allegiance, and to transfer it to a foreign prince (*Macdonald's case*, Foster, Cr. L. 59), unless, as it would seem, by the permission of his own prince (*Doe dem. Thomas v. Acklam*, 2 B. & C. 796; see also *Bright's lessee v. Rochester*, 7 Wheaton, *American Rep.* 535). *Nemo potest exuere patriam* is the fundamental maxim of our constitutional polity; and therefore a natural-born subject who enters into a foreign service, and engages in hostilities against his native country, if taken, may be here punished as a traitor (Foster, Cr. L. 183-4).

(2.) Aliens, or persons born out of the king's allegiance, are still, to a certain extent, while resident here, subject to our laws. Although he cannot hold land or other real property to his own use, an alien may, if a subject of a friendly state, acquire a property in money, goods, or other personal property, may hire a house to live in, may bring actions concerning personal property, make a will, and dispose of his personal estate. During an alien's residence here, he owns a local or temporary allegiance to the crown, and is therefore subject to our criminal jurisdiction; and if, having a family and effects here, leaving them, he goes to his own country, and adheres to his prince in his hostilities against us, he may, if taken, be punished as a traitor by our laws (Foster, Cr. Law, 185). An alien may be made a denizen by royal letters patent, or naturalized by act of parliament. In the last case he is admitted to all the rights of a natural born subject, except the right of becoming a privy councillor, member of parliament, holding offices, grants, &c. A denizen may acquire real estate by purchase or devise, but cannot inherit; but his issue born after denization may inherit from him. He is subject to the same disqualifications as a naturalized subject.

Denizen.

Sect. 3.—The Doctrines of the English Private Law.

284. It is of the essence of a law that it creates rights, and it ought for a violation of those rights to provide an adequate remedy. In considering the general doctrines of English private law, it will be necessary to ascertain what are the rights they originate, for what wrongs they provide, and what are the remedies so provided.

The rights of which a man may be possessed must have reference to persons or to property.* Rights which have reference to persons are those arising out of the various relations, natural or artificial, common in all civilized communities. Of the natural relations to which we allude, the principal result from marriage, from whence are derived the rights of husband and wife; from parentage, whence the rights of father and child; from guardianship, whence the rights of guardian

Rights in respect of persons.

Natural relations

* Blackstone's division of rights, into rights of persons and rights of things, however familiar to our ears, is, as far as the expressions go, so exceedingly objectionable that it has not been, in terms at least, pursued in this chapter.

Law. and ward; and from *service*, whence the rights of master and servants. First, then, as relates to matrimony.

Marriage. (1.) "In civil society, marriage becomes a civil contract, regulated and prescribed by law, and endowed with civil consequences" (*per* Lord Stowell, *Dalrymple v. Dalrymple*, 2 Hagg. Rep. 63). Formerly, in order that the contract should be valid, the marriage must, unless the archbishop had granted a dispensation, or special licence, as it is called, have been celebrated in some parish church, public chapel wherein marriages were usually solemnized prior to the 26 Geo. II. or which has been since licensed for the purpose by the bishop (4 Geo. IV. cap. 76), or place licensed for the purpose and for the performance of divine service during the repair of the church or chapel (*Ibid.* 5 Geo. IV. cap. 32). Now, however, those who prefer it may have their marriage solemnized in the presence of the superintendent registrar of the district, in a licensed place of worship or not, without any ceremony other than a declaration by both parties of their intention in the act (6 & 7 Wm. IV. cap. 85). Otherwise it must be celebrated by a person whom the parties believe to be in holy orders (4 Geo. IV. cap. 76); and, however the marriage be solemnized, the parties must not be subject to the canonical disabilities of precontract (but see *Harg. Co. Litt.* 79 b), consanguinity, affinity,* or impotency, nor under the legal disabilities arising from a subsisting marriage, want of age, want of consent of parents or guardians, which in cases of minors is necessary, and want of reason (see 15 Geo. II. cap. 30). Parties under legal disabilities cannot contract a marriage—the contract is *void ab initio*. The marriage of parties under canonical disabilities, not being those of affinity and consanguinity, is merely *voidable*, that is, can be avoided by proceedings in the ecclesiastical courts, but subsists until a sentence is there obtained. The marriage of

* The 32 Hen. VIII. cap. 38, declares that all persons not prohibited by God's law may marry, and that all marriages are indissoluble contracted by lawful persons in the face of the church, and afterwards consummated. Nothing is to impeach a marriage (God's law excepted) not within the Levitical degrees, the remotest of which is that of uncle and niece. All impediments arising from precontracts (except when they had been consummated) were abolished. But this latter clause was repealed by 2 & 3 Edw. VI. cap. 23 (see 26 Geo. II. cap. 33). Before the Marriage Act (26 Geo. II. 33), it is questionable whether any ecclesiastical ceremony was necessary to a marriage (*Jesson v. Collins*, 2 Salk. 437; *R. v. the Inhabitants of Brampton*, 10 East, 288; *sed vide Haydon v. Gould*, 1 Salk. 119). Before the laws of Innocent III., who became pope in 1198, we are told that the ceremony of marriage was not in use in the church; that is, as we suppose, to be valid at common law: the man simply went to the woman's house, and took her away to his own (*Moore*, 170). "Marriage," says Pope Evaristus, "ought not to be contracted in a clandestine manner; for marriage is no otherwise lawful, but when the wife is demanded of such persons as seem to have the government and dominion over the woman's person, and who have the care and guardianship of her; and unless she be espoused by the consent of her parents and nearest relations, and be endowed according to law, and likewise, at the time of her nuptials, receive the sacerdotal benediction, according to custom, by means of prayers and oblation, and also be given in marriage by her *paranymphe*, such marriage is deemed unlawful by the canon law. This was the ancient way of celebrating legal marriages, for otherwise they are only styled *conjugia præsumpta*, and not lawful marriages; and by law are rather termed *adulteria*, *strupra*, and *contubernia*, than lawful marriages. Let no believer or Christian, of what degree soever he be, presume to celebrate wedlock in private, but let him publicly marry in the Lord, receiving the benediction of the priest" (*Ayliffe, Parergon*, 364; see *Fleury, Mœurs des Chrétiens*, p. 228; *Selden, Uxor Hebraica*, lib. i. cap. 28). Chief Justice Pemberton was inclined to think that "words of contract *de presenti* repeated after a person in orders" was a good marriage (*Wild v. Chamberlain*, 2 Show. 300).

parties within the prohibited degrees of affinity and consanguinity is absolutely void. (5 & 6 Will. IV. cap. 54). The ecclesiastical courts are not permitted to dissolve a marriage after the death of either of the parties (*Salk.* 548). When the ground of the dissolution existed *previous* to the marriage, such as consanguinity, and did not arise afterwards, as might be in the case of impotency, the effect of such a dissolution is a total abrogation of the marriage, and all its incidents, from the beginning, improperly called a divorce *à vinculo matrimonii*. In such cases, of course, the issue are bastardized, and each party is capable of contracting marriage with another.*

There is another kind of divorce, a divorce *à mensâ et thoro* (from bed and board), which, without dissolving the marriage, separates the parties. It is decreed by the ecclesiastical courts, when either party has committed adultery, or in cases of extreme cruelty apprehended by one party from the other. The courts, however, in all cases require the fact of adultery or cruelty to be clearly established before they will consent to grant a divorce (*Evans v. Evans*, 1 Hagg. 36). A wife divorced *à mensâ et thoro* is entitled to an allowance from her husband, settled by the ecclesiastical judge, provided she has not eloped from her husband, and is living in a state of adultery (2 Hagg. 199-203).

The law considers husband and wife as one person. The husband is bound to provide his wife with necessities, and must pay her debts for them, unless she has eloped from him and is living in adultery, and he is liable for all her debts contracted previous to marriage. The wife cannot sue or be sued without her husband's concurrence, and in his name, even although she be divorced *à mensâ et thoro*, and have a competent alimony (*Lewis v. Lee*, 3 B. & C. 291).

Husband and wife cannot, in criminal prosecution, give evidence for or against each other; and, except in cases of treason and murder, and in offences of the lowest class, the command or authority of a husband will privilege a wife from punishment. The wife, being presumed to be under the coercion of her husband, can execute no valid deed, nor even, except under special circumstances, can she devise her lands to her husband.

(2.) Children may be either legitimate or illegitimate. A child is called legitimate if born in lawful wedlock, or within a competent time afterwards, the maxim being, *pater est quem nuptiæ demonstrant*; unless, indeed, it can be shown that there was a natural impossibility that the husband of the mother could be the father, or even a probability strong enough, in the view of the judicatory, to rebut the contrary presumption (*R. v. Luffe*, 8 East, 193; *Goodright v. Saul*, 4 T. R. 356; *Le Marchant's Gardner Peerage case*). A parent, being himself competent thereto, is bound to support such of his children as, from infancy, disease, or accident, are incapable of supporting themselves, and is entitled to the benefit of the labour of such as live with him; and he who marries a woman with children is bound to maintain them, being so incapable, until such woman's death (4 & 5 Wm. IV. cap. 76).

* The practice of dissolving marriages by act of parliament, on the ground of adultery, commenced with the case of Lord de Roos, in 1692: only five Acts of the kind passed up to the accession of Geo. I.: there were between 1715 and 1775 sixty; from that time to 1800, seventy-four; and thence to 1830, about ninety (1 Burge, *Comm.* 655).

- Law.** A parent may maintain his children in their lawsuits, and is justified in committing assault and battery in their defence. While they are minors, he may correct them with moderation, and may delegate this authority to their tutor or schoolmaster; he may appoint their guardian by his will, and, during his life, act as their trustee, and receive the profits of their property, for which he must account to them when they reach their majority. The child is equally bound to support and assist the parent, their duties being reciprocal. By a recent statute, judges in equity are empowered to afford mothers, against whom adultery has not been established, access to their infant children, and, if these latter be under the age of seven years, to give them into the custody of such mothers (2 & 3 Vict. cap. 54).
- Rights of the parent.**
- Duties of the child.**
- Illegitimate children.** The mother is bound to support her illegitimate children; but if they become chargeable to the parish, the father, if he can be ascertained (the mother's oath not being taken as conclusive of the fact), is liable (4 & 5 Wm. IV. cap. 76).
- An illegitimate child is called *filius nullius*, and, although he may obtain a surname by reputation, can neither inherit nor have heirs, except of his own body.
- Guardianship.** (3.) Previous to the statute of Charles II., hereafter noticed, the father might, by deed or will, assign a guardian to any woman child under the age of sixteen; and in default of such assignment, the mother was to be guardian (4 & 5 Ph. & M. cap. 8; 3 Rep. 39).
- Guardians in socage.** The guardianship of a minor inheriting an estate in lands of the tenure of socage, devolves on the next of kin, on whom the inheritance cannot possibly descend, as it would otherwise be "*quasi agnum committere lupo ad devorandum*" (Co. Litt. 88 b; Fortescue, *De Laud.* cap. 44; 1 P. Wms. 260; Harg. Co. Litt. 88 b). From this guardianship the infant is relieved when he reaches his fourteenth year. There are also testamentary guardians, who are appointed by virtue of the 12 Car. II. cap. 24,* which authorizes any father by deed or will to dispose of the custody of his child, born or unborn (7 Ves. 348), to any person, not being a popish recusant, either in possession or reversion, until such child attains the age of twenty-one years, or, in the case of a female, marries (Mendes v. Mendes, 3 Atk. 625). The testamentary guardian supersedes the guardian in socage, and has the custody and management of the real and personal property of the infant, to whom he is obliged to account when the infant comes of age.
- Testamentary guardians.**
- Guardians appointed by Chancery.** If the father appoints no guardian, the Court of Chancery will do so, on the petition of the infant (*Ex parte Salter*, 2 Dick. 769); and the same court will appoint another guardian, where the first refuses to act (1 Sch. & Lef. 106); and it will take care that these, as well as testamentary guardians, act rightly by the ward (Duke of Beaufort v. Berty, 1 P. W. 702).
- Guardians to natural children.** Strictly speaking, a father cannot appoint testamentary guardians to a natural child; but, if he names in his will persons to act as such, the court, on petition, will appoint those persons (Chatteris v. Young, 1 Jac. & W. 106). In order for their own protection, therefore, guardians are in the habit of applying to the court, and acting under its direction (1 Comm. 463). Its jurisdiction in the case of wards has been traced no higher than the year 1696 (Harg. note, Co. Litt.
- 88 b). An infant may be sued in his own name; but he defends himself by his guardian; and one, if he has none, will be appointed for this express purpose (*ad litem*) by the court in which the action is brought. An infant cannot alien his estate; but if a trustee or mortgagee, he may convey his interest as such under the direction of a court of equity. He may purchase lands, but disown the purchase, if he will, when he becomes of full age; and he can also bind himself by contracts for necessaries, but not beyond.
- Law.**
- (4.) Under the head of *service*, it will be sufficient to remark that, in the cases of *menial servants*, unless any special contract be made, it is understood that the hiring is for one year, terminable at any period by the giving of a month's notice or a month's wages. *Apprentices*, who are one class of servants, are those who are bound by deed to serve their masters for seven years, to be maintained and instructed by them. They may be discharged from their service, on reasonable cause, by a justice of the peace, or by the justices at quarter sessions. They nominally have the exclusive right of exercising their trade, but practically this does not exist (5 Eliz. cap. 4, s. 31; 54 Geo. III. cap. 96). To trades not in existence when the first-named Act passed, and to trading in country villages, this law never applied. A master may give his labourer reasonable correction; and any servant, &c. assaulting his master or mistress, may be imprisoned one year, or undergo any other corporeal punishment, not extending to life or limb.
- Authority of the master.**
- A master may maintain his servant in his actions at law, and himself bring an action for the beating of his servant, assigning as his reason his damage by the loss of his servant's service, a loss that must be proved on the trial. He may justify an assault in defence of his servant, as may a servant in defence of his master (Tickell v. Read, Lofft. 215). An action can be maintained by a master against any one who induces his servant to leave his service, in which way it is that a parent can punish the seducer of his daughter. By some evidence, however slight, he must, to sustain the action, prove that the daughter was in the habit of performing acts of service to him indispensable; but the action cannot be maintained if the daughter have left the parental roof with no intention of returning. Such an action may be brought even by an adopted father (11 East, 23).
- Rights of the master.**
- A master is generally answerable for his servant's conduct, if acting in obedience to his commands—and whatever a servant is permitted to do in the usual course of his business is equivalent to a command—and, in some cases, for his servant's negligence.
- Liabilities of the master.**
- The only artificial relation of which any notice need here be taken is that of *partnership*, which is an union of individuals for certain undertakings. Partnership may be constituted either by the spontaneous act and *merus motus* of the parties, or by the operation of law.
- Partner ship.**
- First, then, as to voluntary partnership:
- It is, in general, constituted by an agreement among individuals, to share in the profits of their joint undertaking in some concern. Communion in profits, in proportions however unequal, constitutes a partnership as far as the public are concerned, and presumptively as between the parties; a presumption capable, however, of rebuttal, on the establishment of the fact that no partnership was intended.
- Voluntary partnership.**

* This celebrated statute was drawn by Lord Hale. *Eyre v. Countess of Shrewsbury*, 2 P. W. 125. But see Harg. Co. Litt. 108 a, n. (1).

Law.

The act or agreement of one partner, in relation to and in the course of the partnership business, is esteemed the act of the firm, and binding on all the partners, even although the fact of their being partners be unknown, and whether they be *dormant*,* as the partner is called who does not visibly appear in the management of the partnership, or *nominal*, as he is called who, without having any interest in the profits, allows his name to be used, and deceives the public by appearing as a partner. But, of itself, a mere admission of partnership, to one who has contracted with the firm, fixes an individual with no liability on account of the contract, if the admission was made *subsequently* to the contract. Nor can any one sue another as partner, if he has been informed of a stipulation that the latter should not participate in the profits or losses of the partnership. It must, also, be distinctly understood that an agent, such as a traveller, clerk, factor, broker, &c., in receiving or agreeing for a commission or similar profit on the sale of goods, does not *quoad hoc* constitute himself a partner.

A partner cannot sue his co-partner *at law* in respect of anything connected with or involving the consideration of the partnership accounts: these, with all partnership affairs, are properly the peculiar province of a court of equity.

Secondly, as to those partnerships which are created by law, and called corporations. These are considered artificial persons, to whom the law ascribes the quality of immortality. A corporation may be sole, when its privileges belong only to one natural person and his successors; or it may be aggregate, when it includes a number of persons and their successors. Thus a bishop and a parson are instances of corporations sole, and their successors do not properly inherit from them, but take the property they possessed, in virtue of their character as their successors. Of a corporation aggregate, a dean and chapter is a familiar example. These corporations are in fact metaphysical entities, creations of law (10 Rep. 32); and so far so, that their possessions are not understood to belong to their members, but to that abstract being which they constitute in their united existence. In reference to their purposes, corporations are either *ecclesiastical* or *lay*; ecclesiastical corporations being such as are composed wholly of spiritual persons, as in the instances above given; lay corporations, the members of which include laymen. The first exist for spiritual purposes: of the latter there are three kinds—civil, eleemosynary, and trading. Civil corporations exist for certain political purposes, for the government of towns and cities; for the promotion of education, *e.g.* the universities and their colleges; for the protection of the public from incompetent practitioners of medicine and surgery; and for the prosecution of inquiries into the arts and sciences, and generally for assisting in the advancement of knowledge. Eleemosynary corporations are those of a charitable kind, and intended for the distribution of alms, and the relief of the sick and needy. Trading corporations are those partnerships on which corporate privileges are conferred, in consideration of the vastness of their operations, and the benefit consequent to the country

at large. Of such a kind are the East India and South Sea Companies, and the Bank of England, and many others, similar in kind, however inferior in importance.

Corporations must be created in one of two ways, either by the king's prerogative, or by act of parliament. The consent of the king to the erection of a corporation may be expressed or implied. It is implied in all cases of corporations at the common law, as the corporation of a parson, dean and chapter, and the like; and in corporations existing by prescription, as the City of London, which has been a corporation time whereof the memory of man runneth not to the contrary. It is expressed, when he creates the corporation by his royal charter. This charter is often confirmed by act of parliament; and this is done when privileges transcending the existing laws are to be granted, as the right, for example, of taxing the subject. The crown is also empowered to incorporate certain associations with certain limited privileges. In the case of municipal corporations, the crown is empowered by act of parliament (7 Will. IV. and 1 Vict. cap. 78), on the petition of the inhabitant householders of any borough for a charter, if, advised by the Privy Council, it should think fit to grant the same, to extend to such new corporation all the powers and provisions of the general Municipal Corporations Act (5 & 6 Will. IV. cap. 76), which confers on these bodies many very important privileges. The crown, in granting a charter to a class, may authorize a person or persons to ascertain the individuals composing that class (*per* Denman C. J., and Williams J., *Rutter v. Chapman*, 8 M. & S. 106, *et seq.*), and, it has been said, may even delegate to an individual the power of appointing the first members of a corporation (*per* Tindal C. J., and Patteson J., *ib.*; *Sutton's Hospital case*, 10 Rep. 23; *Bro. Ab. tit. Prerogative*, 53; *Jenkins, Cent.* 87, p. 270). The parties ascertained or appointed, however, derive their qualities and rights from the charter, and not from the individual naming or ascertaining them (*per* Coleridge J., *Rutter v. Chapman, ut sup. cit.*).

A corporation must have a name. All corporations have—(1) perpetual succession; (2) are sued and sue, implead and are impleaded, grant and take, in their corporate name, in which they do all the acts of natural persons compatible with their corporate existence; (3) may purchase lands, and hold them for the benefit of themselves and successors;* (4) usually have a common seal, the affixing of which binds the corporation; (5) usually make bye-laws, which, so far as they are not repugnant to the king's prerogative, or to the common profit of the people, are binding on all the members of the corporation. A corporation, being an invisible person, (1) must appear by attorney; being an artificial person, (2) can commit no crime, nor be (3) subject to personal injuries; it cannot (4) act as an

* Subject, however, to the statutes of mortmain, which make void the alienation of lands in perpetuity to any corporation, without licence from the crown, with certain exceptions,—one in favour of poor vicarages and of Queen Anne's Bounty, and another in favour of gifts of land, or money to be laid out in land, for charitable uses, which are good if made by deed executed in the presence of two witnesses, twelve months before the donor's death, and enrolled six months before his death in the Court of Chancery (2 Comm. 268-74; and see 43 Geo. III. cap. 107, and 45 Geo. III. cap. 101). Being excepted out of the Statute of Wills (34 Hen. VIII. cap. 5), corporations cannot take lands by devise, except in some cases for charitable purposes (43 Eliz. cap. 4; 9 Geo. II. cap. 36).

* A dormant partner is not, however, bound by an express contract with the known and acting partners; and as respects contracts impliedly entered into with the partnership by persons ignorant of his being a partner, his liability ceases *ipso facto* on his ceasing to be a partner.

Law.

Creation

poration.

Law.

executor, administrator, or trustee;* and, having no soul, (5) cannot be subjected to ecclesiastical censures. A corporation aggregate may take goods and chattels for the benefit of themselves and their successors; and so may a sole corporation, when it be the representative of a number of persons, as the master of a hospital, who is a corporation for the benefit of the poor brethren; but not so sole corporations, representing none but themselves, as bishops, parsons, &c. (1 *Comm* 477; 2 *Comm* 431-2), with exceptions of a local and peculiar kind. As a rule, the majority in an aggregate corporation binds the minority (see 27 Hen. VIII. cap. 27; *R. v. Monday*, Cowper, 538; 1 Kyd. *Corp.* 400, &c.).

Visitation.

To prevent a corporation from deviating from its end, it (with the exception of such as are in their nature merely trading corporations) is properly subjected to visitation. Of all ecclesiastical corporations, the ordinary is usually the visitor; of all lay corporations which are eleemosynary, the founder, his heirs or assigns; and of the remainder, the king, either through the medium of the Court of King's Bench (1 *Comm* 481-2), or rather, perhaps, through the medium of the Chancellor (see *R. v. St. Catherine's Hall*, 4 *T. R.* 233). In this last case it was held, that in default of the founder's heirs, and of a special visitor appointed by the founder or charter, the king, in the person of his chancellor, had the right of visitation. The principle which governed this case, one of an eleemosynary lay corporation, one might suppose would extend to all such cases in which the king could act as visitor.

Dissolu-
tion of cor-
porations.

Corporations may be dissolved by act of parliament, by the natural death of all of its members, by a surrender of its franchises into the hands of the king, or by forfeiture of its charter if it have abused those franchises. On its dissolution, its lands revert to its founder, donors, or their heirs.

Rights to
property.

We now come to consider the rights which relate to property. These rights differ according as the property is, in the view of the law of England, *real* or *personal*. Real property is said to consist of *lands*, *tenements* and *hereditaments*; lands including every species of soil, with its produce, as woods, mines, &c., with edifices that stand on it, and even lakes or ponds. Tenement signifies properly that which, in law phrase, may be *holden*, that is, possessed, subject to the superior right of another; and hereditament, that which may be inherited; and this properly would be applicable to personal as well as real property (*Co. Litt.* 6).

Real pro-
perty:corporeal,
and

Real property or hereditaments, as is the usual phrase, is of two kinds; *corporeal*, which includes every species of property comprised under that *nomen generalissimum* (*Co. Litt.* 4 a), land; *incorporeal*,† which imports certain rights issuing out of a thing corporeal, or concerning, or annexed to, or exerciseable within the same (1 *Comm.* 20). Of incorporeal hereditaments Blackstone enumerates ten sorts: (1.) Advowson, which is the right of presentation to a church or ecclesiastical

incor-
poreal.

benefice (see Div. IV. vol. xvii. p. 140). (2.) Tithes (see Div. IV. vol. xxviii. p. 654). (3.) Common, or right of common, whether common of pasture, which is a right of feeding one's beast on another's land; or of piscary, which is a right of fishing in another man's water; or of turbary, which is a liberty of digging turf on another man's ground; or of estovers, which is a liberty of taking necessary wood from another's estate (see Div. IV. vol. xx. p. 67). (4.) Right of way, which is the right one may have of going over another man's ground. (5.) Offices, which are a right to exercise a public or private employment, and to take the fees and emoluments thereto belonging. (6.) Dignities, which are titles of honour and precedence. (7.) Franchises, which are royal privileges granted to a subject (see Div. IV. vol. xxii. p. 314). (8.) Corodies, which are rights of sustenance, or of receiving a certain allotment of provisions for one's maintenance (see Div. IV. vol. xx. p. 261). (9.) Annuities are similar in their nature, only they arise from temporal, not spiritual, persons (see Div. IV. vol. xvii. p. 616). (10.) Rents, which are certain profits issuing yearly out of certain lands and tenements corporeal (see Div. IV. vol. xxvii. p. 17).

Law.

As to that species of real property included in the term corporeal hereditaments, we will consider the modes, first of its enjoyment, and secondly of its acquisition. The various modes of enjoyment are called estates, which may be considered in reference (1) to their quality, (2) quantity, (3) certainty, (4) time, and (5) number of persons participating.

By the law of England all land is supposed to be *Tenures*. holden mediately or immediately of the king,* a doctrine which may be referred to the early periods of our legal history. The various species of tenure are so fully described in other parts of this work,† that it is unnecessary to do more than notice a few striking incidents to their character.

Tenures, by their very nature, required that every transfer of the land should be made by public delivery of possession. Ulphus, the son of Toraldus, turned aside into York, and filled the horn he was wont to drink out of with wine, and before the altar, on his bended knees, drinking it, gave away to God, and to St. Peter, the prince of the apostles, all his lands and revenues. The delivery being thus public, the ownership was always patent and notorious, a favourite object with our ancient common law (*Taylor v. Horde*, 1 Burr. 108). Tenures imposed on the tenant the necessity of rendering certain fruits and performing certain services to his lord; and if he committed any act in derogation of his lord's rights, he forfeited his

Notoriety
of transfer
and posses-
sion.

* Corporations, however, are considered by the Court of Chancery as trustees for charitable purposes (*Lydiat v. Sir John Foach*, 2 Vern. 412); but for no others, (see *Mayor of Colchester v. Lowton*, 1 Ves. & Bea. 244). Under some circumstances the court will even remove them from their trust (*Mayor, &c. of Coventry and Att. Gen.*, 7 Bro. P. C. 235).

† "*Res incorporales*," says the civilian, "*autem sunt, quæ tangi non possunt: qualia sunt ea quæ in jure consistunt, sicut hæreditas, usus-fructus, usus, et obligationes quoquo modo contractæ*" (*Inst.* II. 2). The definition is much too large for our purpose, but conveys a distinct notion of the subject.

* The source of this royal right is explained by an eminent antiquary, who tells us that "King William I. was seized of the whole kingdom of England in demesne; that he retained part of it in his own seisin, and other parts thereof he granted and transferred to others." (*Madox, Bar. Ang.* book i. c. 2, p. 25) — a statement utterly irreconcilable with history, for *Domesday* teaches us that many persons held, in the days of the Conqueror the same land of which they were possessed in the time of the Confessor, and in the same way; and besides, William swore at Westminster to maintain his new subjects in their rights, and to govern them by their ancient laws. There is no question that the true origin of the doctrine is to be found in the ancient Teutonic polity, which considered the ownership of all lands as vested in the state or people (*Cæsar, De B. G.* l. iv. s. 1., l. vi. s. 22; *Tacitus, De Mor. Germ.* s. 26), of which the king was afterwards held the representative (*Allen, Rise and Growth of Royal Prerog.* 131-64).

† Division IV. vol. xxviii. p. 502

Law.

interest in the lands. A system like this, bears visible impress of its military origin, and to military considerations is the maxim clearly ascribable, that the tenancy of the land should always be filled, and that the tenant could make no disposition of his interest likely to involve a vacancy in the same tenancy, although but for a moment. The system which gave birth to tenures, and which has imported so many doctrines into our law, has long passed away: its effects, however, still remain, and correctly to apprehend the rationale of common-law estates, reference may be still had with advantage to the *Assises de Jerusalem*, and to the Lombardy feudalists. In process of time, the cunning of the monastic conveyancers, ever fond of subtilizing the law, invented a distinction between the right to property and the right to enjoy the use of property. In this way were the statutes of mortmain (p. 825 n. *antè*) evaded; for the gift was made, not to the convent, but to the use of the convent. This use being an unsubstantial thing, could be subjected in no way to the rules of tenure.* It could not publicly be delivered, nor could it be forfeited; it could yield no fruits, discharge no duties. He to whom it belongs, so long as the legal estate was vested in loyal hands, might commit treason with impunity; and it enabled the poor tenant to defy the avarice of his lord. An use could be devised, which a legal estate could not, except in certain places, until the 34 Hen. VIII. cap. 5. To the perfection of this system of uses, the Court of Chancery, where, for many years, an ecclesiastic presided, lent its ready aid; and Sir John de Waltham, in the reign of Edward III., an inferior officer therein, by the invention of a process commonly known as the writ of subpœna, enabled the court to compel the legal or apparent owner of the land† to perform the uses subject to which the land had been conveyed to him. "It would," as Lord Coke very properly observes, "be absurd to say that confidence and trust can be reposed in land, which, in regard to sense, is inferior to brute beasts; and it would be less absurd to say that beasts may be trusted, who have sense, and want reason, than that land, which wants sense and reason also, may be trusted" (1 Rep. 127).

Beneficial estates.

Statute of Uses;

There are, then, two qualities of estates—legal estates, and beneficial or equitable estates. The first are such as derive their existence from the common or the statute law; and the second from the introduction of uses, and which are called equitable, because they have been fostered and protected by the Court of Chancery, the author and expounder of equity law; while the courts of common law refused (4 Edw. IV.), and still refuse, to recognise them. For the purpose either of destroying these beneficial estates (*Co. Litt.* 272; Chudleigh's case, 1 Rep. 131; Gilbert *On Uses*, 74–182), or of removing the abuses to which they had become subject (Bacon, *Reading on Stat. of Uses, Law Tracts*, 332; 2 Sanders, *On Uses*, 89), was enacted the Statute of Uses (27 Hen. VIII. cap. 10), which provides, that where one is seised of lands, &c. to the use of another, he who has the use shall become seised of the lands,

* See Spence's *Inquiry into the Origin of the Laws, &c. of Modern Europe*, p. 9.

† At first, the beneficial owner had nothing to rely on but the honesty of the legal owner; and we are told that the confidence reposed was rarely abused. "The reason why no mention is made in our ancient books of uses is, because men were then of better consciences than now they are; so as the feoffees did not give occasion to their feoffors to bring subpœnas to compel them to perform the trusts reposed in them" (*per* Manwood J., Brent's case, 2 Leon. 15).

&c., and have the same estate, title, right, and possession therein as he previously had in the use. This Act contemplates only the case where there are two persons concerned, one (a feoffee to uses) having the legal estate, and another (the *cestuique trust*) having the beneficial or usufructuary estate; but it did not provide for a case in which land should be conveyed to one for the use of another for the use of a third. It was held, therefore, that the statute operated upon such a transaction as this, simply, in transferring the legal estate to the person to whom the first use was declared, and stopped there, without affecting the third person, in whom the use would consequently still remain. To prevent, then, the statute from destroying uses, all that was necessary was to create, instead of one, two beneficial estates, the first of which is immediately destroyed by the inevitable operation of the statute. "By this means," says Lord Hardwicke, "a statute, made upon great consideration, introduced in a solemn pompous manner, hath had no other effect than to add, at most, three words to a conveyance" (*Davenport v. Oloys*, 1 Atk. 591). This is hardly an accurate representation* of the effect of the Statute of Uses, which not only added three words to a conveyance, but has served to convey to the "legal ownership all the flexible and popular qualities of the use" (Hayes, *Introd. Conv.* ch. ii.); for it has been "the course of the statute to bring the possession to the use" (*per* Walmesley J., Bacon, *Reading*, 324), and not to impose on the use the fetters to which the common law subjected the possession.

defeated in construction.

It may be proper here to observe, that, formerly, the trustee attainer or conviction for high treason of a trustee, or person holding the legal estate, while the beneficial estate is in the hands of another, was followed by the same consequences as if he were the beneficial owner; but the rule is now done away with, except as to any beneficial interest which the trustee might have in the trust property.

The *quantity* of the interest has reference both to the nature of the quality absolutely, and perhaps to the number of the tenants.

(I.) Estates are either freehold or less than freehold. Freehold estates are of inheritance or not of inheritance. Freehold estates of inheritance† are, (1) estates in fee-simple, (2) in fee base, and (3) in fee tail, or conditional. Freehold estates not of inheritance are, (1) estates tail after possibility of issue extinct; (2) for life; (3) by the courtesy of England; and (4) dower. Estates less than freehold are, (1) estates for years, (2) at will, (3) year by year, and (4) by sufferance.

These and their incidents must be briefly described. First, then, of freehold estates of inheritance.

(1.) Tenant in *fee simple* (or in fee, as he is usually

Feesimple.

* Vaughan C. J. describes the principal effect of the statute as having been "to introduce a general form of conveyance, by which persons may execute their intents and purposes at pleasure, either by transferring their estates to strangers, by enlarging, diminishing, or altering them, to and among themselves at their pleasure, without observing that rigour and strictness of law as was requisite before the statute" (Vaughan, 50).

† It must be borne in mind that the estates of inheritance hereafter described, are those which the law will alone recognise; nor is it competent to any one to make a new inheritable estate at his will (*Co. Litt.* 13 a, 27 b); so that if a gift were made to one and his heirs *male*, the law would reject the word *male*, and the estate descend to the heirs generally; but if the limitation appeared in a will, the gift would be construed as importing an estate tail (*Litt. s.* 31; *Co. Litt.* 27 a; see also the famous Prince's case, 8 Rep. 32-43).

Law.

called) is he that hath lands, tenements, or hereditaments to himself and his heirs for ever, which is the largest and most beneficial estate recognised by the law of England, and is an unqualified inheritance in lands, unlimitable in its duration as to extent (Litt. sec. 1). He is called *tenant* in virtue of the doctrine, just mentioned, which treats the king as the universal landlord—a doctrine so far recognised by our law, that in corporeal inheritances (for to incorporeal the doctrine does not extend) the tenant in fee simple is formally styled as being seised in *his demesne as of fee*.

An estate in fee simple, if undisposed of by the living owner, devolves in inheritance to his heirs in the course indicated by law. To the creation of an estate in fee-simple, or any other inheritable estate, the use of the word "heirs" is generally essential, except in the cases of devises (which are gifts by will), and when the gift is to the king, in whom a fee-simple will vest, although the word "heirs" be not used.

Fee base.

(2.) A *fee base* is such a fee as hath a qualification subjoined thereto, and is determinable as that qualification terminates; as if lands are given to a man and his heirs, being lords of a particular manor (Preston, *On Estates*, 431-2). The owner, while his estate lasts, has all the rights and privileges of a tenant in fee simple (1 Cruise, *Dig.* 79).

Fee tail.

Statute *De Donis*.

(3.) A *fee tail* is a conditional fee, restrained to some particular heirs, in exclusion of the others. It derives its existence (Litt. s. 3) from the famous statute *De Donis* (13 Edw. I. cap. 1),* styled, either from its purposes or framers, the Statute of Great Men,† which enacts, that where lands were given to a man and the heirs of his body, they should go to the issue; and if there be no issue, then should revert to the donor; and declares that an alienation by the first taker was *contra formam doni*. On the construction of this statute, the judges divided the estate given into two parts; one which is the fee tail, and the other called the *reversion*, which is the ultimate fee simple expectant on the failure of issue. All corporeal hereditaments, and incorporeal concerning, annexed to, issuing out of, or which may be exercised within corporeal, as rents, commons, and the like, may be entailed. An estate tail (as it was first called in Westminster II. 13 Edw. I. cap. 4) may be general or special, male or female. It is *general*, when it is to the heirs of the body generally; *special*, when to certain heirs, as heirs by a particular wife, &c.; *male* or *female*, when to the heirs male or to the heirs female of the body respectively. The principal incidents to a tenancy in estate tail are, (1) the right of the tenant to commit what is called *waste*; he may pull down houses, fell timber, and do like acts,

The reversion.

Species of estate tail.

Incidents of the estate.

which in the case of inferior estates would induce forfeiture; (2) his widow shall have her dower out of the estate; (3) the husband of a female tenant-in-tail may be tenant by the courtesy of the estate; (4) and the estate itself may be destroyed by the tenant executing a deed, which must be enrolled in the Court of Chancery six months after execution, and which must purport to be a conveyance in fee of the land entailed, and must have the consent of a certain party named in the act, if the estate tail be expectant on a particular estate or estates of a certain description (3 & 4 Will. IV. cap. 74).

As to freehold estates not of inheritance; and first of—

(1.) *Estate tail after possibility of issue extinct*—a denomination applied (to alter the definition of Dr. Wooddeson) to the estate of a male or female donee* in tail, whose husband or wife, as the case may be, from whom the inheritable issue was to spring, is deceased, leaving no issue living, so that there remains no possibility that the estate should be transmitted according to the form of the gift; a possibility which is equally absent when the parties have been divorced for some cause which makes the marriage void *ab initio*; but then they have not this estate, which must proceed from the act of God, but are simply tenants for life (Woodd. *Lect.* 19; *Co. Litt.* 28 a). That one should have this estate, he must once have had a descendible estate; and he is distinguished chiefly by his non-accountability for waste (that is, for pulling down houses, felling trees, and so despoiling the land†) from a tenant for life. If he aliens his interest, his alienee takes, according to Coke (*Co. Litt.* 28 a), only an estate for life—a doctrine which has been impugned by Lord Hale (Note on *Co. Litt.*, *ut sup. cit.*, Harg. edit. n. 6).

(2.) *Estate for life*, which is where a lease is made of lands or tenements to a man to hold for his own life or for the life of another, or for the lives of certain others. In these last cases he is called tenant *pur autre vie* (Litt. s. 56). A grant made without expressing the quantity of interest intended to be passed, is construed to convey an estate for the life of the person to whom it is made (*Co. Litt.* 42 a). Except for necessary repairs, and at seasonable times, a tenant for life may not fell timber‡ (*Co. Litt.* 53), nor commit other waste, but is entitled to reasonable estovers or botes, and his executors to emblements—advantages which belong, even in a greater degree, to his under-tenant.

(3.) *Tenant by the courtesy of England*, is the life estate to which the husband is entitled, after the death of his wife, in those lands in which she was actually possessed of an estate of inheritance, when he has had issue by her born alive, and capable of inheriting her estate.

(4.) *Tenant in dower*.—For an explanation of this

* It rather re-established than created entails (Taylor v. Horde, 1 Burr. 115; see Barrington's commentary on the statute).

† "Il y fueront sages gents queux fieront c'est statut," said Sir William Herle, Chief Justice of the Common Pleas; "and I may say," observed Coke, "qu'ils fueront sages gents interpretent c'est act" (2 Inst. 335). It certainly had not the effect intended. Of the skilful lawyer, whose character he paints in such vivid colours, Chaucer tells us that—

"All was fee simple to him in effect"

(Prol. v. 321, Works, 1798): so soon did the wisdom of those who interpreted get the better of the wisdom of those who made the statute. One of its objects was to relieve the estates of the nobles from the penalty of forfeiture in cases of high treason (Bacon, *Use of the Law*; *Law Tracts*, 143. 1737); but to this, estates in tail were afterwards subjected (26 Hen. VIII. cap. 15, s. 5; see Div. IV. vol. xxviii. p. 417).

* In a work intended for general readers exclusively, it may not be thought unnecessary to state that the relation of persons to a conveyance is, in technical phraseology, marked by the conclusion of the legal appellations. Thus, the donor gives; the donee is he to whom the gift is made; mortgagor, he who mortgages; mortgagee, he to whom the mortgage is made.

† It was said that, although punishable for waste, the tenant after possibility had no property in the timber (Herlakenden's case, 4 Rep. 63); but this has been denied; but it is established that wilful devastation of the property will be restrained by injunction from the Court of Chancery (Williams v. Williams, 15 Ves. jun. 427).

‡ It is *equitable* waste in a tenant for life to cut timber "planted or growing for ornament," as distinguished from timber which is merely ornamental in fact (see Strathmore v. Bowes, and other cases quoted, Hayes, *Conv. App.* 22-3, *ut sup. cit.*).

Law.

Law.	estate, reference may be made to the Fourth Division of this work (vol. xxi. p. 417).	year's notice to quit, expiring at the period of the year when the tenancy commenced—a rule which does not apply to the case of a weekly tenancy of furnished apartments, in the absence of any agreement to that effect (Chitty, 340). The notice may be verbal or in writing, unless it have been agreed that it should be in writing, certain as to the premises given up, and extending to the whole of the premises. Great facilities have been given to landlords by a late act of parliament (1 & 2 Vict. cap. 74) in recovering possession of premises after the determination of certain tenancies.	Law.
Estate for years.	(1.) <i>An estate for years</i> , which is any estate, by whatever words created (<i>Co. Litt.</i> 45), that must expire at a period, however remote, certain and prefixed; from which circumstance it is often called a <i>term</i> . The tenant for years is entitled to the same estovers, and, with a slight exception, his executors have the same rights as to emblements, unless he should have renounced them by special contract, which a tenant for life has.	(4.) <i>An estate at sufferance</i> is where one comes into possession of land by lawful title, but keeps it afterwards without any title at all. A common instance of this is a tenant holding premises unmolested, over the time for which they were let to him.	Estate at sufferance.
Estate at will.	(2) <i>An estate at will</i> , as its name imports, is where lands or tenements are let to be held at the will of him who lets them, and no longer. A general letting of land, <i>i. e.</i> , a demise without limit as to the period of holding, was, up to the reign of Henry VIII., held to create this estate, which is now scarcely known, as the courts no longer consider that a tenancy at will arises <i>by implication</i> , when the tenancy is not expressly agreed to be a tenancy from year to year. But a person who holds rent-free by the permission of the owner is still considered a tenant at will (<i>R. v. Collett</i> , Russ. & R. C. C. 498).	By the <i>certainty</i> of interest is properly to be understood estates either <i>conditional</i> or <i>absolute</i> ; conditional estates being those whose existence depends upon the happening or not happening of some uncertain event, whereby the estate may be either originally created, enlarged, or finally defeated (<i>2 Comm.</i> 152). Absolute estates are such as depend upon no contingency whatever. Conditions may be implied or expressed: for example, where a grant is made to a man of an office, the law implies the condition that he shall hold it only so long as he duly executes the same; and failing so to do, he who granted it, or his heirs, may lawfully deprive him thereof.	Conditional estates.
Estate from year to year.	(3.) <i>An estate from year to year</i> may arise not only from express stipulation, but even from that general letting heretofore held to constitute an estate at will, with the exception, it would seem, of lodgings (<i>per Lord Mansfield</i> , <i>Right v. Darby</i> , 1 T. R. 159). It may arise from a variety of circumstances, not compatible with our design to detail; but we may remark a singular example of the interpretation of a statute, that although the legislature provided that an agreement in words (a parol agreement, as it is termed) for a term for more than three years, not reduced to writing and signed, should operate as a tenancy at will, it has been held that an agreement without such formalities operates as a tenancy from year to year (29 Car. II. cap. 3; <i>Clayton v. Blakey</i> , 8 T. R. 3). The mere payment of rent affords a presumption, which may be rebutted, of a general letting from year to year (<i>Doe dem. Pritchard v. Dodd</i> , 5 B. & Ad. 689); and the person who pays the rent may show on whose behalf it was received (<i>Doe dem. Harvey v. Francis</i> , 2 M. & Rob. 57). In the absence of an express agreement, the tenant is liable only when an injury happens to the premises through voluntary negligence, and not from injuries arising from accidental fire, wear and tear of time, or the like (<i>Woodfall, Landl. and Ten.</i> by Harr. 3rd edit. 398). In the case of a farm, a promise is implied on the part of a yearly tenant, that he will use it in an husbandlike manner, and cultivate the lands according to the custom of the country where they are situate (<i>Chitty, On Contracts</i> , 337, 3rd edit.). A landlord is not liable to an action for not repairing, unless he has agreed to repair; but if the premises, through want of repair, should become uninhabitable and profitless to the tenant, he will, under some circumstances, be at liberty to quit without further notice, and discharged of any liability to future rent.	Conditions impossible when created, becoming afterwards impossible by the act of God, or the act of their maker, contrary to law, or repugnant to the nature of the estate, are void. If such a condition is to be performed <i>after</i> the estate vests (as in the case of a gift to A, on condition that he shall marry B by a certain day), the estate at once becomes vested absolutely in him to whom it is given, discharged of the condition. If such a condition is to be performed <i>before</i> the estate vests (as in the case of a grant to A, that he shall have a certain estate if he goes to Rome in one day), the condition being void, so also is the estate, which was to arise only upon its performance. The most ordinary kinds of estates upon condition are mortgages (<i>Div. IV.</i> vol. xxv. p. 297), and estates by statute merchant, statute staple (<i>Ib.</i> vol. xxviii. p. 37), and <i>elegit</i> (<i>Ib.</i> vol. xxi. p. 456), which have been too fully noticed elsewhere to require any comment in this place.	Conditions impossible.
Liability of tenant.		Estates considered in reference to the <i>time</i> of their enjoyment—the time when the rents and other advantages can lawfully be taken—are either in <i>possession</i> , <i>remainder</i> , or <i>reversion</i> . When the interest actually resides in the tenant or owner, he is said to have an estate in possession; when an estate is limited to be taken after another estate has determined, according to the very nature and extent of its original limitation, it is an estate in remainder.	Possession.
Liability of landlord.		Remainders are either <i>vested</i> or <i>contingent</i> . A remainder is <i>vested</i> where one has an immediate fixed right of future enjoyment, an estate <i>in presenti</i> , although it is only to take effect in possession of the profits at a future period; and this is such an estate as may be transferred, aliened, and charged much in the same manner as an estate in possession (<i>Cruise, Dig. tit. Remainder</i> , ch. i. s. 9).	Remainder.
Termination of the tenancy.	If there be no express agreement on the subject, and no immemorial usage prevailing in the place to the contrary, one party, or if dead, his personal representative, must, in order to terminate the tenancy, give to the other, or his representative in a like case, half a	A remainder is <i>contingent</i> so long as the future estate has no capacity of taking effect in possession on the determination of the particular estate. Into the	contingent.

Law. profound and complicated learning relating to contingent remainders, it is here unnecessary to enter, nor would a brief consideration of their qualities possess any practical value. The incomparable treatise of Mr. Fearne is too well known to render it necessary to observe, that there may be found all that can be required on the subject.

Reversion. An estate in reversion is the residue of an estate left in the grantor, to commence in possession after the determination of some particular estate granted out by him (2 *Comm.* 175); or it may be perhaps better defined as the returning of the lands in possession to the donor or his heirs, after the grant is ended (*Co. Litt.* 142 b).

Estates considered in reference to the *number of persons participating* in their enjoyment, are estates in joint tenancy, tenancy in common, and in coparcenary; but these have been treated at sufficient length in the Fourth Division of this work (vol. xxviii. p. 492), so that it is unnecessary to allude further to them in this place.

Title by possession. Having now discussed, as completely as our limits would allow, the modes of enjoyment of real property, we now come to consider the manner in which it may be *acquired*. It may be acquired by merely obtaining *possession*, that is, the actual occupation of the estate; and if this be accomplished in opposition to the rights of its legal owner, it will lie with him, by the assertion of those rights, and by an appeal to the tribunals of his country, to eject the intruder. Until this is done, the actual possessor has, in right of his possession, *prima facie* evidence of a legal title; and this possession may, by length of time, and negligence of the lawful owner, ripen into a perfect and indefeasible title. No title can be completely good without actual possession. This, however, is a title capable of being defeated. The other modes of acquiring property, recognised by the law of England, are of two descriptions: property may be acquired by either *descent* or *purchase*.

Descent is where the title to property vests in a man by the single operation of law; and *purchase*, where the title vests in him by his own act or agreement, conjointly with such operation, or independently thereof (2 *Comm.* 201).

Title by descent. (I.) *Descent*.—When a man, on the death of his ancestor, acquires his estate in right of being his representative, he is said to take by descent. The law, in order to prevent the confusion which would naturally ensue on the death of any one possessed of property, were the future right to that property undetermined, has wisely, by a variety of rules, defined and ascertained the person who shall be so entitled, and who, in reference to the deceased, is termed his heir at law. The rules regulating descent are thus stated by Blackstone:—

Canons of descent. (1.) Inheritances shall lineally descend to the issue of the persons who last died actually seised, *in infinitum*, but shall never lineally ascend.

(2.) The male issue shall be admitted before the female.

(3.) Where there are two or more males in equal degree, the eldest only shall inherit; but the females all together.

(4.) The lineal descendants *in infinitum* of any person deceased shall represent their ancestor; that is, shall stand in the same place as the person himself would have done, had he been living.

(5.) On failure of lineal descendants or issue of the

person last seised, the inheritance shall descend to his collateral relations, being of the blood of the first purchaser, subject to the three preceding rules.

(6.) The collateral heir of the person last seised must be his next collateral kinsman of the whole blood.

(7.) In collateral inheritances, the male stock shall be preferred to the female (that is, kindred derived from the blood of the male ancestors, however remote, shall be admitted before those from the blood of the female, however near), unless where the lands have in fact descended from a female (1 *Comm.* 208–234).

These rules now exist—subject, however, to certain 3 & 4 provisions contained in a late act of parliament (3 & 4 Will. IV. cap. 106), which was passed in accordance with the recommendations of the commissioners for inquiring into the law of real property (*First Report*, pp. 10–16).^{*} This Act provides, (1) that the descent shall always be traced from the purchaser, that is, the person who last acquired the land otherwise than by descent, escheat, partition, or enclosure; but that the last owner shall be considered as the purchaser, unless the contrary be proved (s. 2); (2) that the heir entitled under a will shall take as devisee, and that the limitation to the grantor or his heirs shall create an estate by purchase (s. 3); (3) and that where heirs take by purchase under limitations to the heirs of their ancestor, the lands shall descend as if the ancestor had been the purchaser (s. 4); (4) that brothers or sisters shall trace descent through their parent (s. 5); (5) that every lineal ancestor is capable of being heir to his issue, and is heir in preference to collateral persons claiming through him (s. 6); (6) that the male line of inheritance is to be preferred (s. 7); (7) that the mother of more remote male ancestors be preferred to the mother of less remote male ancestors (s. 8); hereby recognising the propriety of Mr. Justice Blackstone's opinion (2 *Comm.* 238), so long contested, and by such respectable authorities. The only other provision in this act deserving of notice, is the abolition of the rule excluding the half blood. Now, the half-blood, if on the part of a male ancestor, inherits after the whole blood of the same degree; if on the part of a female ancestor, after her (s. 9). This Act, it should be observed, does not extend to any descent taking place before the 1st day of January, 1834 (s. 11); nor to limitations, made before the same date, to the heirs of a person then living; these take effect as if the Act had not been made (s. 12).

(II.) *Purchase*.—Acquisition by purchase may be effected either partially by operation of law, or wholly by an act of the parties. (1.) Of the first mode of acquisition there are several species, which we shall notice in their turn. First, acquisition by *escheat*. Where one dies without heirs, his lands are said to escheat, or fall to the lord of whom they were holden. With the exception of lands of copyhold or customary tenure, this lord is the king. This defect of heirs may arise in a variety of ways; and, amongst others, from the doctrine of corruption of blood, as it is called, by which, when one is attainted of treason or convicted of murder, he loses his capacity of transmitting his property by way of inheritance. In the case of attainder for treason, the land, unless it be copyhold, is forfeited to the crown absolutely; but,

^{*} The value of some of these changes is attested by Lord Loughborough's observations in *Brydges v. the Duchess of Chandos*, 2 Ves. jun. 426.

- Law** in the case of conviction for murder, the crown becomes possessed only for a year and a day, and afterwards the lord takes by way of escheat. Secondly, there is acquisition by *forfeiture*, which is a punishment annexed by law to an illegal act or negligence committed by the owner of lands or hereditaments, whereby he loses all his interest therein, and they go to the party receiving the injury, as a recompence for the same. The illegal acts upon which forfeiture is consequent, are chiefly—(1) crimes and misdemeanors; (2) alienation contrary to law; (3) nonperformance of conditions; (4) waste; (5) breach of copyhold customs; (6) bankruptcy.
- Forfeiture:** (1.) Crimes and misdemeanors. He who commits treason or misprision thereof, felony, *præmunire*, draws a weapon on a judge, or strikes any one in the presence of one of the king's principal courts of justice, forfeits his lands and tenements to the king. In the case of persons committing treason, the forfeiture is absolute, and vests in the king for ever all such lands, tenements, and hereditaments of inheritance, in fee simple or fee tail, as the criminal was possessed of when the treason was committed, and discharged of all incumbrances induced subsequently to such commission. The king also takes the profits of all lands and tenements which the criminal had in his own right for life or years, so long as such interest shall subsist. In felony and the other crimes above mentioned, the offender forfeits all his lands and tenements in fee simple to the crown for a short period; for the king shall have them for a year and a day, and commit on them what waste he pleases. These forfeitures are usually compounded for. Forfeitures of this description also relate back to the time when the offence was committed.
- for crimes and misdemeanors;** (2.) Alienation contrary to law. A gift contrary to the statutes of mortmain, and alienation to an alien, involve forfeiture to the crown of the lands purposed to be so given or alienated. Further, alienations by particular tenants, of estates greater than the law entitles them to convey, being in contravention of the rights of those entitled to the remainder or reversion, are forfeitures to him whose rights are sought to be infringed: as for example, if one who has a life estate should pretend to convey the fee simple, which is an estate larger than his own, he is, in intendment of law, considered to have by his own act determined his original interest.
- treason;** (3.) Nonperformance of conditions. We have already spoken of conditional estates, and it is sufficient here to observe, that the breach or nonperformance of lawful conditions annexed to these estates produces forfeiture of the same.
- felony.** (4.) Unlawful waste is punished by forfeiture of "the *thing* (construed to extend to the *place*; 2 *Inst.* 303) wasted" (Stat. Glouc., 6 Edw. I.). If waste be done at one end only of a wood, or perhaps in one room of a house, if capable of convenient separation, that part only shall be forfeited (2 *Comm.* 284).
- Alienation contrary to law.** (5.) Breach of the customs of copyhold manors in many cases subjects the tenant to a forfeiture of his possession. As it is probable that these customs will speedily disappear under the influence of the new enfranchisement Act, already alluded to, this is a subject hardly worth dwelling upon.
- Non-performance of conditions.** (6.) Bankruptcy: hereafter is defined what constitutes an act of bankruptcy: it is sufficient here to observe, that a bankrupt's real and personal estate becomes, under a process hereafter to be described, vested in certain persons, who will deal with the same, under certain restrictions, for the benefit of the bankrupt's creditors.
- Bankruptcy.** Thirdly, title by *prescription*, which is only to incorporeal hereditaments, such as rights of common, rights of way, and the like, arises where one can show that he and those under whom he claims have, for a certain period, been accustomed to enjoy the same as of right. This enjoyment must be had, not secretly, by stealth, by tacit sufferance, or by permission asked from time to time on each occasion, or even on many occasions, of exercising it; it must be had openly, notoriously, without particular leave at the time, by a person claiming to use it without danger of being treated as a trespasser, as a matter of right (*Tickle v. Brown*, 6 N. & M. 239). Claims to rights of common, and other profits, to be taken and enjoyed upon the lands of the king, or any ecclesiastical or lay person or body corporate, cannot be defeated after thirty years' uninterrupted enjoyment, by showing their commencement prior to such period; and after sixty years' enjoyment, such rights become absolute and indefeasible, unless it should appear that the same were taken and enjoyed by some consent or agreement expressly made or given by deed or writing. Claims to rights of way, and other easements, when such have been actually enjoyed without interruption for twenty years, are defeasible by showing their commencement prior to such period; and after an enjoyment for forty years, the right thereto becomes absolute and indefeasible, unless it could be shown to have been taken and enjoyed by some consent or agreement expressly made or given by deed or writing. Right to the use of light enjoyed for twenty years, unless it appears that the same was enjoyed by consent or agreement, is indefeasible (2 & 3 Will. IV. cap. 71).
- Acquisition by act of the parties.** Having thus shown the various modes of acquisition by operation of law, wholly and partially, we have now to consider the modes of acquisition by act of the parties.
- Deed of conveyance:** And first, then, of acquisition by deed of conveyance, which is a writing sealed and delivered by the parties. In treating this subject it will be proper to consider—(1) who may convey, and to whom; (2) what may be conveyed; (3) what are the requisites of a deed of conveyance; and, (4) what are its kinds, and their operation.
- Convey;** (1.) Conveyances to and by idiots, lunatics, infants, who may and persons under duress, are not void, but voidable; that is, should the idiot or lunatic recover his reason, the infant attain his majority, the person under duress be relieved thereof, they may affirm or avoid these transactions, according to their pleasure. The conveyance, or other contract of a married woman, during her marriage, is absolutely void: she may, however, be a purchaser without consent of her husband, and the purchase is good until he avoids it by some act of dissent; but if he does not, she herself may do so, after his death. Those attainted of treason, felony and *præmunire*, are incapable of conveying from the time of the commission of their offences.
- what may be conveyed.** (2.) The mere right by the possession of the property cannot be the subject of a conveyance; nor can be contingencies or mere possibilities be assigned to a stranger, unless coupled with some present interest; but a reversion or a remainder vested may be granted, because the possession of a particular tenant is the

- Law.** possession of him in reversion or remainder: it is the possession that is the proper object of every conveyance.
- Deed must be written.** (3.) To constitute a valid deed, it must be written or printed on paper or parchment, sealed and delivered: notwithstanding the Statute of Frauds, signature is not necessary.
- Species of deeds.** (4.) The various species of deeds may be properly considered under two heads: first, those which are effectual at common law; and, secondly, those which derive their operation from the Statute of Uses.
- Feoffment.** Of the first kind is the feoffment, which is a conveyance of corporeal hereditaments from one person to another, by delivery of the possession upon or within view of the hereditaments so conveyed. To complete the operation of the feoffment, must be performed the ceremony called "livery of seisin," which was the delivering, upon the land, in the presence of witnesses, of a detached portion of the soil. It is this livery which is considered to pass the land: the charter of feoffment operates merely as the record or written evidence thereof.
- Gift.** A gift is properly a conveyance in fee tail, and, equally with feoffments, requires livery of seisin. A grant is the proper method at common law of transferring the property in incorporeal hereditaments, or such things whereof no livery can be had. A lease is a conveyance of lands or tenements made for life, years, or at will, but always for less interest than he who makes it hath in the premises: it is usually made in consideration of rent or other annual recompence, and the general words of operation are, "demise, grant, and to farm let." As to what is capable of being demised, it is obvious that whatever may be granted or parted with for ever, may be granted or parted with for a time; and thus we hear of leases of live cattle for a year (*Billingsley v. Hersey*, 2 Bulst. 7); and also of household goods for certain periods, and on certain considerations. Incorporeal hereditaments may generally be the subjects of a lease: this, of course, does not include judicial offices, nor peerages.
- What can be leased.** As to who may lease—such as are of full age, and seised in fee, may of course grant leases of any duration. Infants making leases can avoid the same on attaining their majority. A tenant in tail may make a lease to endure for not more than three lives, or twenty-one years, and such a lease binds his issue in tail, but neither remainder-men nor reversioners. A husband, seised in right of his wife in fee-simple or tail, may make a similar lease, provided the wife joins therein, and which will bind her and her heirs. All persons seised of an estate in fee simple, in right of their churches, not including parsons and vicars, may, without the concurrence of any other, make such a lease as will bind their successors. That the lease should be valid, it must comply with the numerous requisitions of the statute (32 Hen. VIII. cap. 28). The leases of ecclesiastical corporations are subject to various restrictions (5 & 6 Vict. cap. 108).
- Who may lease.** An assignment is a transfer or making over to another of the interest which one has in the unexpired residue of a term or estate for years. A release is a discharge or conveyance of a man's rights in lands or tenements to another, that hath some former estate in actual possession.
- Assign-ment.** Of conveyances which derive their operation from the Statute of Uses, the lease and release is the instrument in the most frequent use. Its origin may be thus explained: before the passing of the Statute of Uses, a mere contract for sale, made in consideration of money or other valuables, paid to the seller, was sufficient to transfer the use; for the law not recognising the use, none of the solemnities necessary for the transfer of property were required. After the passing of the Act, which brought the possession to the use, it was easy, by a mere contract transferring the use, to transfer the possession as completely as if all the legal requisitions had been complied with. To prevent this, an Act was passed (27 Hen. VIII. cap. 16) by which every such contract, bargain, and sale, as it was called, was declared void, if embracing freehold property, unless made by a writing, sealed, and enrolled, within a certain period after its execution, in the Court of Chancery. This Act did not, however, extend to terms for years; and contracts for the sale of beneficial interests in such were still valid, although not enrolled. It became then usual to contract, for a nominal consideration, to sell the use of land for one year; and the purchaser had immediately the possession transferred to him by the operation of the statute. Having thus acquired the possession, the seller, in whom the inheritance remained, executed to him a release, relinquishing all his interest in the land, and thus was the transaction completed. The lease and release was, we are told by *Fabian Philips*, at first purposely contrived by *Francis Moore*, at the request of the Lord Norris, to the end that such of his kindred or relations should not take notice, by any search of public records, what conveyance or settlement he should make of his estate (*Treatise on Capias*, p. 115). The necessity for a lease or bargain and sale for a year is removed by the 4 Vict. cap. 21. There are several other deeds deriving their operation from the Statute of Uses, which it does not fall within our plan to notice.
- Release.** Freedom of alienation was unknown to early times; and we owe the power of transferring by will, or, as it is technically called, devising, to a statute of Henry VIII. Previous to that time, no greater interest would pass by a will than a term for years. Wills are denominated, by Lord Dyer, the laws that private men are allowed to make, and they have effectually served to prevent an accumulation of property, which would have materially impeded the social and political improvement of the country. Before the Statute of 32 H. VIII. cap. 1, devises were indirect, and had their operation in consequence of some feoffment to the use of a will, which the Court of Chancery would enforce: the Statute of Wills, however, corrected by the 34 Hen. VIII. cap. 5, authorized all persons seised in fee simple, not being a wife, an infant, an idiot, or a person of not sane memory, by will an testament in writing, to devise to any other person except bodies corporate, two-thirds of their lands, tenements, and hereditaments held in chivalry, and the whole of those held in socage, which now in fact amounts to the whole of their landed property not being copyhold.
- Lease and release.** The law relating to devises is now regulated by the 7 Will. IV. and 1 Vict. cap. 26, which has abolished the whole of the former statute law relating to wills. Of its provisions we have now to give some account.
- First, as to who may make a will. A will may be made by any one not under twenty-one years of age, not an idiot, a lunatic or person of unsound mind, or a married woman. This last disqualification is subject to certain exceptions; for a married woman may make

Law.

Wills.

32 H. VIII. cap. 1.

34 H. VIII. cap. 5.

7 Will. IV. and 1 Vict. cap. 26.

Who may make a will.

Law. a will if her husband be banished for life by act of parliament; or also, it would seem, if he be transported for a fixed term of years as a felon. A married woman may also make a will of property settled to her separate use, or an appointment by will in pursuance of a power to be executed notwithstanding the subsistence of her marriage.

How the will is to be made. Secondly, as to how the will is to be made. In order to be valid, the will must be in writing, and signed at the foot by the testator, as the person making the will is called, or by some other person in his presence, and by his direction; and such signature must be made or acknowledged by the testator in the presence of two or more witnesses present at the same time; and such witnesses must attest and subscribe the will in the presence of the testator. Any interest whatever in real or personal estate, given or appointed to any person, or to the wife or husband of any person, who shall attest the execution of the will, is void. Such person is nevertheless to be admitted a witness to prove the execution, validity, or invalidity thereof. Creditors, however, may be attesting witnesses without forfeiting the benefit of any charge contained in the will for the payment of debts.

Revocation of wills. Thirdly, as to the mode of revocation. The revocation of a will can be effected by another will or codicil, duly executed as aforesaid, or by some writing declaring an intention to revoke the same, and executed as an original will must be; or by the burning, tearing, or otherwise destroying the instrument by the testator, or by some person in his presence and by his direction, with the intention of revoking the same. The marriage of the testator is a revocation of any will made by him previously.

What may pass by a will. Fourthly, as to what may pass by will. Every person may devise, bequeath, or dispose of, by his will (or codicil) duly executed, all estates, real and personal, to which he shall be entitled at law or in equity at the time of his death, and which, if not so devised, bequeathed, or disposed of, would devolve upon his heir at law or customary heir, or, if he became entitled by descent, upon the heir at law or customary heir of his ancestor, or upon his own executor or administrator. This includes estates of customary freehold or tenant right, or customary or copyhold, although the ancestor may not have surrendered, or, being entitled, as heir, devisee, or otherwise, to be admitted thereto, he shall not have been so admitted. It extends to estates for the life of another (*pur autre vie*), whether the same be freehold, customary freehold, tenant right, customary or copyhold, or of any other tenure, and whether the same be a corporeal or incorporeal hereditament. It includes all contingent, executory, or other future interest in any estate real or personal, whether or not the testator be ascertained as the person, or one of the persons, in whom the same may become vested, or whether he be entitled thereto under the instrument by which the same respectively were created, or under any disposition thereof by deed or will. It extends also to all rights of entry, and embraces all such of the same estates, interests, and rights respectively, and all other estates real and personal, to which the testator may be entitled at the time of his death, although, perhaps, subsequent to the execution of his will. By the law as it stood previous to the Wills Act, a devise to A, not naming his heirs, and being unaccompanied by any words from which the intention to devise the fee could

be collected, was held to pass only an estate for life. The new Wills Act has altered this rule, by enacting that if real estate be devised to any person without any words of limitation, such devise will be construed to pass the fee simple, or other the whole estate or interest which the testator had power to dispose of by will in such real estate, unless a contrary intention appear by the will.*

We have now to treat of personal property, or, in legal phrase, goods and chattels; which comprehends all species of possessions not freehold, and not capable of descending to the heir at law, but which, on the owner's death, vest in his executors or administrators.

Chattels are considered by the law to be of two kinds, real and personal. (1). Chattels real, are such as concern or savour of real property, such as, terms for years, the next presentation to a church, and the like, and are called real, as being interests issuing out of, or annexed to, real estates. (2). Chattels personal, are properly things moveable, such as animals, household stuff, money, corn, and so forth.

(I.) The most usual mode of acquiring personal property is marriage. All chattels which belonged formerly to the wife are, by act of law, vested in the husband, with the same degree of property, and the same powers as the wife, when unmarried, had over them.

Chattels real belonging to the wife cannot be disposed of by the husband by will, if he dies before his wife, in case of his not having dealt with them during his lifetime. So with *choses in action*—as personal chattels are called, whereof a man hath not the occupation, but the bare right to occupy, such as debts upon bond, contracts, and the like,—if the husband reduces them into possession by receiving or recovering them at law, they become wholly and entirely his own; but if at his death they are still *choses in action*, they survive to the wife. All chattels which the wife has in her own right, become the property of the husband on his marriage. If, however, her personal property is so circumstanced that the husband is forced to crave aid from a court of equity in reducing it into possession, the court will grant its assistance only on the terms that the husband makes a competent settlement in favour of his wife,

(II.) *Grants or gifts* of chattels personal are defined as the right of transferring the right and possession of them, whereby one renounces, and another immediately acquires, all title and interest therein. Properly to constitute a gift or grant, it should be accompanied with delivery of possession; for then it is out of the giver's power to retract it, even although he gave it without any consideration or recompence. It will be void, however, if made in prejudice of creditors, or if the giver were under legal incapacity.

(III.) Contract is defined by Blackstone to be an agreement, upon sufficient consideration, to do or not to do a particular thing. That a contract should be binding, there must be a promise by one party, and an accept-

* In reference to this provision in the Act it may be observed, that previously it was thought that if a man devised particular lands, which he had not at the time, but afterwards purchased, or devised all lands which he should die seised of, that such devises would be valid. Lord Chief Justice Saunders, under this impression, devised all lands which he had, or afterwards should have, in Fulham. His executors were Holt and Pollexfen, Chief Justices, and Mr. Sergeant Maynard. The latter thought the devise invalid, contrary to the opinion of the Chief Justices (*Laurence v. Dodwell*, 1 Lord Raym. 438). Holt subsequently altered his opinion.

Law. **Express contract.** **Implied contract.** **Consideration.** **Contract of sale or exchange.**

ance thereof by another (Pothier, *Oblig. P. I. c. 1, s. 1, art. 2*). The agreement must be, in general, obligatory upon both parties, or neither will be bound. A contract may be *express* or *implied*. An *express* contract is where the terms of the agreement are openly uttered and avowed at the time of the making, such as to pay a certain price for certain goods. An *implied* contract is such as reason and justice dictate, and the law therefore presumes every man undertakes to perform. If I take up wares from a tradesman without any agreement of price, the law concludes that I contracted to pay their real value (2 *Comm.* 443). A valid and sufficient consideration or recompence is of the very essence of a contract: without it, the promise is void, and creates no legal responsibility.

The most usual contracts by which the right to chattels personal may be acquired are, (1) contracts for the sale or exchange of goods; (2) bailments; (3) contracts of hiring and borrowing; (4) contract of debt.

(1.) A sale or exchange is a transmutation of property from one to another, in consideration of some price or recompence in value. If the transfer be for money, it is a sale; if for goods by way of barter, it is an exchange. In the case of a sale of goods generally, as distinguished from the sale of a specific chattel, no property in them passes until they are delivered. Up to that time they remain the property of the seller. But if, by the contract or bargain, the seller appropriates to the buyer a specific chattel, and which the latter agrees to take and pay for at a stipulated price, the effect of the contract is to vest the property in the buyer at once.

Market overt. The general rule is, that one who has no authority to sell, cannot, by making a sale, transfer the property to another. This rule is subject to an exception. A sale of goods by one not rightfully entitled to them, does transfer the property, if it be a *bond fide* sale, and effected in market overt. Market overt, or open market, is a fair or market held at stated intervals, by virtue of a charter or prescription; but in the city of London, every shop is, except on Sunday, market overt, in respect of the goods usually and publicly sold therein, and appropriate to the trade of the occupier. This exception must be taken subject to the provisions of the 7 & 8 Geo. IV. cap. 29, which entitles the owner of any chattel, &c., or other property stolen, to restitution, although such chattel may have been *bond fide* sold in the interval, provided the owner or his executor prosecute the thief or receiver to conviction, and the court award restitution.

Solemnities of a contract of sale. No contract for the sale of any goods, wares, or merchandises, for the price of 10*l.* or upwards, shall be allowed to be good, except the buyer shall accept part of the goods so sold, and actually receive the same, or shall give something in earnest to bind the bargain, or in part of payment, or unless some memorandum or note in writing of the same bargain be made and signed by the parties to be charged with such contract, or their agent thereunto lawfully authorized (29 Car. II. cap. 3). This enactment is extended to all contracts for the sale of goods of the value of 10*l.* and upwards, notwithstanding the goods may be intended to be delivered at some future time, or may not at the time of such contract be actually made, procured, or provided, or fit or ready for delivery, or some act may be requisite for the making or completing thereof, or rendering the same fit for delivery (9 Geo. IV. cap. 14, s. 7).

Law. **Contract of bailment.** (2.) Bailment is a delivery of goods in trust, upon a contract expressed or implied, that the trust shall be faithfully executed on the part of the bailee; that is, the person to whom such delivery is made. Thus, if goods be delivered to an innkeeper, and, whilst in the inn, they be damaged or stolen, either by the servants of the innkeeper or by strangers, the innkeeper is liable. So is a carrier, who, for hire, undertakes the carriage of goods for any person, either by water or land, considered to be under a contract in law to convey them safely. If one delivers anything to his friend to keep for him, the receiver is bound to restore it on demand, and is in the meantime answerable for its damage or loss, if occasioned by his gross neglect. With the possession, a special qualified property is transferred from the bailor to the bailee, enabling this latter to vindicate in his own right his possessory interest against any stranger.

(3.) Hiring and borrowing are contracts, whereby the possession of transient property is transferred for a particular time or use, on condition to restore what is so hired or borrowed on the expiry of the time, or the performance of the use, and in case of hiring (for borrowing is merely gratuitous), paying the price agreed on by the parties, or implied by law from the value of the service. The hirer or borrower obtains a temporary property in the thing, subject to an implied condition to use it with moderation. The owner or lender retains his reversionary interest, and acquires a new property in the price or reward.

(4.) Debt, which includes every contract whereby a determinate sum of money becomes due to any one, and is not paid, but remains in action merely. A debt of record is a sum of money appearing to be due by the evidence of a court of record; debts by specialty are when a sum of money becomes or is admitted to be due by instrument under seal; debts by simple contract are such where the contract is either oral or contained in writing not sealed.

(IV.) *Bankruptcy.*

Acquisition by bankruptcy. (1.) As to who may be a bankrupt. The various classes of traders capable of becoming bankrupts are enumerated in the 6 Geo. IV. cap. 16, s. 2, and the 5 & 6 Vict. cap. 122, s. 10. Aliens, denizens, women, persons residing even in Scotland, Ireland, the Isle of Man, the British colonies, or in any foreign country trading to or from this country, may be made bankrupt here. It would seem that a married woman is subject to be made a bankrupt, if she carries on trade free from the control of her husband, and if he be not answerable for the debts contracted by her in it. Peers, members of the House of Commons, servants of foreign ambassadors, clergymen, and public officers may be bankrupts, if they be traders.

(2.) As to what acts constitute bankruptcy. These are minutely detailed in the Bankrupt Consolidation Act, of Geo. IV. To leave the country, to remain abroad, to suffer or procure an undue arrest, fraudulently to convey lands or other property, are considered so many acts of bankruptcy, if done with intent to defeat or delay creditors.

(3.) How one may be made a bankrupt. Any creditor (whose debt amounts to a hundred pounds or upwards), if a trader within the Statute of Bankrupts, may apply to the Lord Chancellor by petition, stating that his debtor is a trader, the nature and amount of his debt, that he has become bankrupt, and praying

Law. his lordship to issue his fiat, authorizing the petitioner, as such creditor, to prosecute his complaint in her Majesty's Court of Bankruptcy. This fiat being granted, it is opened by one of the commissioners of the Court of Bankruptcy; and proof being given before them of the petitioning creditor's debt, of the fact of the trading, and of the act of bankruptcy, the trader is declared a bankrupt. It is then usual for the creditors to choose certain persons to act as trustees on their behalf, and who are called assignees. These having been chosen, all the personal effects and estate of the bankrupt become vested in them, and all his lands, tenements and hereditaments (except estates tail, for which special provision is made by the 3 & 4 Will. IV. cap. 74, ss. 55-6) in the United Kingdom, or any of the dominions, plantations, or colonies belonging to the king. The assignees or commissioners dispose of the bankrupt's property for the benefit of the creditors. In order to facilitate the examination of the various claims of creditors against the bankrupt's estate, it is desirable that the bankrupt should be examined; and if he fails therefore to surrender himself, and submit to be examined before the court, or upon examination does not discover all his real and personal estate, and how he has dealt with it, and surrender his books and papers, within a certain period after he has been declared a bankrupt, he is punishable with transportation for life, or not less than seven years, or with imprisonment, with or without hard labour, for not exceeding seven years. If he do surrender himself, submits to a full examination, and makes a true discovery of his estate and effects, he may reasonably expect his certificate, which is an instrument reciting the whole proceedings, and contains a consent, by a certain proportion of his creditors, that he shall have such allowance and benefit as are given to him by statute, and be discharged from his debts. The property of the bankrupt is, of course, divided amongst his creditors.

Acquisi- by insol- vency; (V.) *Insolvency*.—The probability that a sweeping change will speedily be effected in the laws relating to insolvent debtors renders a bare reference to the recent Acts (1 & 2 Vict. cap. 110, and 5 & 6 Vict. cap. 116) all that is necessary.

by will and admi- nistration. (VI.) *Will*.—Personal property is acquired by will in the same manner as real property; and in the case of persons possessed of personal property dying intestate, the ordinary grants administration to one of the intestate's kindred, by whom the property is divided amongst his next of kin, in conformity with the Statute of Distributions (22 & 23 Car. II. cap. 10; explained by 29 Car. II. cap. 3).

In concluding this rapid review of the doctrines of English property law, a few remarks may be permitted having reference, not to the details of the system, but to its spirit and characteristic features.

Observa- tions on English property law. Whoever studies this system with intelligent attention can scarcely fail to recognise in it a system admirably adapted to the requirements of an ancient and wealthy people, whose commercial pursuits have not abated their pride of ancestry or their attachment to aristocratic institutions. If without manners laws are nothing, laws not congenial to manners are worse than nothing; and the highest praise that can be accorded to any legal system is, that it harmonizes with the genius and spirit of the people. It was well remarked by a great man, *Angustia prudentiæ humanæ casus omnes quos tempus reperit non potest capere* (*De Augm.*

lib. viii. cap. iiii. aph. 10). But this is a poverty the legislator has been slow to perceive; and thus we find him in many countries, instead of relinquishing to individual prudence the task of arranging for the future enjoyment of property, undertaking of himself arbitrarily to define to whom, and how, that enjoyment should be secured, as though there were given to him foresight to anticipate all possible exigencies, and wisdom to provide arrangements adequate to their satisfaction. Thus, in the *Code Civil*,—that great work by which the modern Caesar of France hoped to realize the glory coveted by his predecessor of old,—while instead of the so-called illiberal law of primogeniture, equal partibility was made the rule, freedom of alienation was greatly shackled by the numerous restraints upon voluntary gifts, whether testamentary or made *inter vivos*. Freedom of alienation is one of the most striking characteristics of our own law, which in all cases leaves the disposition of property as free as is consistent with public policy. Not to interfere with the individual—to relinquish to him, as far as may be, the full control over his own—is the rule of English law. It does interfere, indeed, to prevent private caprice from being a source of public mischief; and thus, as we have already seen, it will not suffer the creation of a new inheritable estate; nor will it permit an estate tail to be so limited as to be inalienable; nor will it suffer the creation of any estate inalienable beyond a certain period (Sugden, note, Gilbert *On Uses*, 260). These and various other things it forbids, as contravening some principles of public policy.

One of its provisions has been frequently attacked, Law of and often defended with more zeal than discretion. primoge- niture. This is the doctrine of primogeniture. The extent of its operation has been greatly overrated, or we might inquire on what ground it has been made the subject of such hot dispute. The law of primogeniture does not hold when the heirs are females; it does not hold in the case of personal property, the aggregate of which far exceeds descendible land in produce and value. In all settlements, the widow's jointure and the younger children's portions (which are personal property) are charged on the estate, and form large deductions—the one from its income, and the other from its capital (Humphreys, *Observations*, 201). "Intestacy"—and it is only in cases of intestacy that the law of primogeniture can have any operation—"but rarely happens where there is property to give, and the owner of it has a family or relations for whom he is anxious to provide; and it would be impossible, by a general law, to make a proper distribution applicable to all the different circumstances arising from the state, ages, and rank of the family, and the nature and value of the property. The general law is well adapted to the great classes of society engaged in professions and trade, where an intestate who has real property has usually personal property of much greater value, which is divided among all the children" (Mr. Tyrrell's *Suggestions* [24]; *First Rep. Real Prop. Com.* p. 480). We may remark, in the first place, that "it is not so material that these arbitrary rules should be the one way or the other, as that they should be fixed" (*per Sir W. Grant, M. R., Lord Oxford v. Lady Rodney*, 14 Ves. 425). And looking to the feelings and wishes of the great body of the larger number of landed proprietors in this country, "the rule" could scarcely be "fixed" any "way" more congenial to those feelings than by

Law.

Law.

devolving the real property on the representative wholly and undivided, instead—for this is the alternative—of dividing it into fragments, which will assuredly lower the position and dignity of the family, and possibly contribute nothing to the advantage of its members.

Settle-
ments.

The system of "settlements" adopted in this country appears admirably calculated to reconcile the maintenance of a family, by the preservation of its landed property, with the claims of the wife and the younger children. "The extent of the power of settling estates, or creating different interests, in this country," says Mr. Tyrrell, "is generally approved of as a proper medium between too great a restraint upon alienation or an insufficient protection to the aristocracy. Estates may be settled by deed or will, so as to secure the possession of them to the family as long as the policy of encouraging a free commerce in land can reasonably permit; at the same time every privilege may be given to the person in possession, consistent with the preservation of the property, which he could exercise if he were the absolute owner. The tenant for life may be empowered to provide out of the estate for his wife and his younger children, and to grant leases, work mines, cut timber, and sell or exchange the estate. When he has a son of the age of twenty-one years, he can, with his concurrence, re-settle or alien the property; and it is usually settled, on the marriage of the son, for the benefit of the next generation; and if no such settlement be made, the son, during the life of the father, cannot absolutely dispose of the inheritance" (*First Rep. Real Prop. Com.* p. 484 [41-2]). Most effectually in this way are accomplished all the advantages which a system of equal partibility would secure, and without the evils it necessarily occasions.

Legal and
beneficial
estates.

Here also we may remark, what the reader can scarcely have failed to notice of himself, the singular peculiarity in English law, which distinguishes between the right to property and the right to enjoy the use of property; this latter right being recognised and enforced by a distinct judicatory, guiding itself by rules, both of law and evidence, unknown to the ordinary tribunals of the land; seeking, it is probable, in the first instance, to do little more than relieve individuals from the heavy pressure of laws imperfect and often morally unjust.* Courts of equity insensibly progressed, until they emancipated property from the trammels of feudality,

* *Jeo aie oie mon Seigneur Coke a citer, two verses pur ceo hors de Sir Thomas More—*

"Three things are to be helpt in conscience,
Fraud, accident, and things of confidence."

(Rolle, *Ab., Chancery* (N.), 1). Mr. Fonblanque (*Treat. on Equity*, p. 9, 5th edit.) expounds the theory of courts of equity after this fashion. He considers them as in some cases assistant to, in others concurrent, and in others again exclusive of the jurisdiction of courts of common law.

It assists the jurisdiction of these—(1) by removing legal impediments to the fair decision of a question depending in a court of law; as in the case of an ejectment brought to try a title, equity restrains the party in possession (unless he have an equal claim to its protection) from setting up such a defence as will prevent a trial of the right; (2) by compelling a discovery which may enable it to decide; (3) by perpetuating testimony when in danger of being lost before it has been used. It is also assistant, by rendering the judgments of law courts effective—(1) by providing for the safety of property in dispute, *pendente lite*; (2) by counteracting fraudulent judgments; and (3) by putting a bound to vexatious and oppressive litigation. It exercises a concurrent jurisdiction with courts of law in many cases of fraud, accident, mistake, account, partition and dower, but claims an exclusive jurisdiction in most matters of trust and confidence.

and established a system of rights and remedies adapted to the necessities of an improving state of civilization. Such a spectacle as this embodies a striking warning against rash speculations on the effects of untried laws and imagined institutions. What would have been anticipated from the existence in the same country of two systems of law—distinct in their origin—dissimilar in many of their doctrines—administered in different courts, differing materially in the process by which they severally investigate submitted controversies, and enforce their respective judgments? Nothing but confusion and uncertainty in the law, to terminate only with the absorption or annihilation of one jurisdiction or the other. Lord Bacon spoke of the Court of Chancery to James I. as "the court of your absolute power;" and so it was originally considered. Speculating, then, upon the probable issue of the contest, the judgment would scarcely hesitate as to which would secure the victory. This appears to have been Lord Bacon's apprehension: *Maxime omnium interest certitudinis legum, ne curiæ prætoris intumescant et exundent in tantum, ut prætextu rigoris legum mitigandi etiam robur et nervos iis incidant aut laxent, omnia trahendo ad arbitrium* (*De Augm. lib. viii. cap. iii. aph. 43*). We know; because we have seen the event, that these apprehensions were groundless: we detect in the progress of equity the steps to perfecting a system adapted perfectly to our wants, and capable of indefinite expansion to satisfy the requirements of an altered society.

If it be thought these striking improvements, which we owe to courts of equity, were properly the work of the legislature, we cannot deny it; but still may be permitted to rejoice, looking at what our statute law is, that the legislature did not make the attempt. Innumerable would have been the questions raised—lengthened the litigation—doubtful for long the decisions with which a statute, disturbing to such an extent ancient and familiar rules, would have tasked the patience of the suitors and the wisdom of the judges. It is the nature of a statute law, let its provisions be ever so skilfully framed, to import uncertainty into the law, and to affect injuriously its scientific capabilities. "Sure am I," says Lord Bacon, "there are more doubts that rise upon our statutes, which are a text law, than upon the common law, which is no text law" (*Proposal for amending the Laws*).

The refinements with which our property law abounds are ascribable clearly, first, to the fact that the foundations of our law, being laid in times remote from the present, not only in years, but in habits of thought, in social character, in political necessities, doctrines and principles, still remain, inconsistent with modern circumstances, but whose removal would involve consequences highly injurious to the law, as impairing its systematic and scientific character (*see some observations of the Real Property Commissioners, Third Rep.* p. 4). To prevent, however, the unrestrained operation of these principles and doctrines, the courts have invented distinctions, subtle, but intelligible enough, which, preserving these principles to maintain the harmony and connexion of the system, still avert the mischief which would ensue on their active operation. Again, these refinements are called for by the minute and ramifying relations of society, which demand modifications of property too various and complicated for a legislature to provide. Citing testimony to this truth, we must conclude. Hear Julianus.

law.

Law. *Neque leges, neque senatus consulta, ita scribi possunt, ut omnes casus qui quandoque inciderint, comprehendantur, sed sufficit et ea, quæ plerunque accidunt, contineri* (Dig. I. 3, 11). *Les besoins de la société sont si variés, la communication des hommes est si active, leurs intérêts si multipliés, et leurs rapports si étendus, qu'il est impossible au législateur de pourvoir à tout. Dans les matières qui fixent particulièrement son attention, il est une foule de détails qui lui échappent, ou qui sont trop contentieux et trop mobiles pour pouvoir devenir l'objet d'un texte de loi. D'ailleurs, comment enchaîner l'action du temps? Comment s'opposer au cours des événemens; ou à la pente insensible des mœurs?* (Disc. Prel. sur Code Civil).

Sect. 4.—Procedure.

Procedure at common law. 285. We have now to treat of civil wrongs and their remedies; civil wrongs being personal injuries, not criminal in their character. It will be desirable to treat of the former under the technical but convenient classification of the latter; a classification which has reference to the nature of the subject of the action.

Actions: real; persons. mixed. Actions, then, are styled real, personal, and mixed. When the action addresses itself to things directly (*actio in rem*), seeking the recovery of real property only, it is a real action; while personal actions are *in personam*, and seek the recovery of specific chattels, or some pecuniary satisfaction or recompence. Mixed actions partake of the nature of both these descriptions. By a late act of parliament, recovery of real property can be obtained at law, with certain exceptions, only in one way;* and the great number of real actions with which our ancestors were conversant are now abolished (3 & 4 Will. IV. cap. 27). Of personal actions, the most common are—(1.) Debt, which is brought where one claims the recovery of a debt, that is, a certain sum of money alleged to be due to him. Generally it is founded on some contract alleged to have taken place between the parties, or on some matter of fact from which the law will imply such contract. (2.) Covenant, which lies where one claims damages for a breach of promise under seal. (3.) Detinue, where a party seeks the specific recovery of goods and chattels, or deeds and writings, detained from him. (4.) Trespass, where one seeks damages for a trespass committed against him, the trespass being an injury committed by violence, actual or implied; the law implying violence where the injury is of a direct and immediate kind, and committed on the person or tangible and corporeal property of the plaintiff. Trespass upon the case is where a party seeks for damages for any wrong or cause of complaint, to which covenant or trespass will not apply. Of this action there are several kinds, two of which are well known.

Assumpsit. Of these, the first is, assumpsit, where one seeks damages for the breach of a promise not under seal. The promise may be implied or expressed, the law always implying a promise to do that which the party is legally bound to perform. Trover is the action usually adopted to try disputed questions of property as goods and chattels. Replevin is an action to try the legality of a distress for rent; and in form the party seeks damages for the illegal taking and detaining of his goods and chattels.

Debt. Covenant. Detinue. Trespass. Case. Assumpsit. Trover. Replevin.

* For the action of ejectment, here alluded to, see Div. IV. vol. xxi. p. 441.

The following is a statement of the more important stages in personal actions.

Law. Writ of summons. All actions of this description commence with a writ of summons directed to the defendant, and issued from a court of law, at the instance of the plaintiff. This writ apprizes the defendant that an action of a certain specified description has been commenced against him by an individual named, and desires him to appear to the action, warning him that, in neglecting to do so, the court will proceed to give judgment and award execution against him. If the action is to proceed controversially, the defendant enters an appearance, as it is called, a mere formal proceeding, which is a proper preliminary to his defending the action. The next step taken is by the plaintiff, who declares the grounds of his complaint in a formal document, which is communicated to the defendant, and the preparation of which requires considerable skill and professional knowledge.*

To this the defendant either *pleads* or *demurs*. In demurring, he objects to the declaration of the plaintiff, as insufficient on legal grounds; being either informal in its statement, or alleging facts which, however true, do not prove that the plaintiff has received any injury. By demurring, the defendant precludes himself from denying the truth of such facts as have been sufficiently pleaded. The law requires the opposite party to deny the allegation of him demurring, and thus the parties are said to be at issue; and this issue being an issue of law, is triable by the judges.

Instead of demurring, however, the defendant may plead, or put in a plea—pleas being of various kinds. They may consist merely of exceptions to the *remedy* to the sought, deny the jurisdiction of the court, or the sufficiency of the plaintiff, as being an alien, &c., or aver other facts, which, without affecting the real merits of the action, impugn simply its conformity to law. They may, on the other hand, be to the *action*, and either deny the truth of the plaintiff's allegations, or avoid their legal effect by setting out other facts, which give them another complexion. The defendant, in short, may either traverse or confess and avoid his opponent's statements (see TRAVERSE, Div. IV. vol. xxviii. p. 735). If he traverses, then must the plaintiff join Traverse.

* It is particularly to be remarked that the practice of pleaders (1 East, 210), as well as the practice of conveyancers (1 Turn. & Russell, 86), "amounts to a very considerable authority; and I am justified in that assertion by some of the greatest men who have sat in Westminster Hall, who, I am persuaded, in many cases, if matters had been *res integræ*, would have pronounced decisions very different from those which they thought proper to adopt" (*per* Lord Eldon, *Smith v. Earl of Jersey*, 2 Brod. & B. 598). Such being the case, it is obviously desirable that this practice should have some standard.

"From which to reason, or to which refer;"

and this is obtained by the spontaneous recognition of the authority of certain text-books. The importance of such works, it is difficult to overrate, and their value is correctly explained by Best C. J., who, in alluding to Phillipps's *Treatise on the Law of Evidence*, says, "I refer to [it] not as authority, but as proof of the understanding of Westminster Hall on the subject" (4 Bingham, 614). Lord Kenyon, in like manner, speaks with great respect of Marius' *Advice concerning Bills of Exchange*, on the ground that "it was written in early times, by a person conversant with the custom of merchants respecting bills of exchange;" and that "the rules laid down by him have been since received by the mercantile world" (6 D. & E. 212). See also the observations on Preston's *Treatise on Conveyancing*, by Bayley J. (8 B. & C. 518), and on Mitford's *Treatise on Chancery Pleadings* (2 Younge & J. 41; 1 Sim. 369-71).

Law. issue; and this issue is to be tried by a jury. It is, however, competent to the plaintiff to prolong the contest, by either demurring to the defendant's plea, or pleading thereto; such plea being called a replication; to which, in turn, the defendant may demur, or put in his rejoinder. The following table shows the titles of the various statements which each party may put forth:—

THE PLAINTIFF.	THE DEFENDANT.
The declaration	The plea
The replication	The rejoinder
The sur-rejoinder	The sur-rebutter.
The rebutter.	

Trial and judgment. When, at length, one or other party traverses, and issue is joined, the trial commences. The various kinds of trial and judgments are enumerated in an article on the subject in the Fourth Division of this work.

Observations on English pleading. The most striking peculiarity in this system is, that the question for the determination of the judicatory is, in effect, stated by the parties themselves; and this, if it enhances the cost, and prolongs the period of the suit, there is little doubt promotes the ends of substantial justice. "It is difficult not to admire the logical skill with which fact is separated from law; and the whole subject of litigation is reduced to one or a few points, on which the decision must hinge" (2 Mackintosh, *Hist. of Eng.* 275).

The late alterations which have been accomplished in our system of pleading, under the authority of the 3 & 4 Will. IV. cap. 42, have served to correct many of the evils which had previously deformed it. "Know, my son," says the great master of our law, "that it is one of the most honourable, laudable, and profitable things in our law, to have the science of well pleading in actions reals and personals; and therefore I counsel thee especially to employ thy courage* and care to learn this" (Litt. s. 534). Coke derives the word plea à *placendo, quia omnibus placet* (Co. Litt. 303); but it is very doubtful if, in his day, the general approbation of the mode of legal procedure warranted such a derivation. There is nothing in the present state of public opinion, most certainly, to warrant it. Still, if forms of proceeding are to exist, and if the discretion of the judge is not to determine the controversies submitted to him, it is difficult to see how the evils complained of can be obviated. "It is easy," says one who will not be suspected of any undue leaning to law conservatism, "to form a conception of justice in the abstract, such as it would appear to the eyes of an infallible judge, well acquainted with all the circumstances of the case; but to distinguish this abstract justice from legal justice would be a vain and dangerous pretension, which would give the judge up to the phantoms of his own imagination, and make him lose sight of the only true guide—the law" (Bentham, *Rationale of Judicial Evidence*). Lord Mansfield observed, that "the rules of pleading are founded in strong good sense," admitting, however, that, "by being misunderstood and misapplied, they are often made use of as instruments of chicane" (Robinson v. Raley, 1 Burr. 214); nor is it possible, in a system necessarily technical, to avoid evils of this kind.†

* That is, ardour. *Corage*, properly, however, signifies anger; and in this sense it is used in the preamble of 1 Edw. III. stat. 1, "Continuant leur mauveste, moverent le corage de dit Roy Edouard."

† The rash confidence with which extensive alterations in our legal institutions have been advised and attempted, indicates,

The procedure in criminal cases is sufficiently explained by various articles in the Fourth Division, and does not appear to demand any further explanation.

The procedure in Chancery has been already sketched in the description given of the jurisdiction of the court; nor is it capable of a more elaborate discussion without involving the consideration of details that would extend this chapter beyond its proper limits.

We have not pretended, of course, to enumerate all civil wrongs, which are as numerous as the rights of which they are infractions; but it is sufficient for our purpose to indicate the more usual modes of legal redress, and the more usual injuries.

Such is a faithful outline of the great doctrines of English law. And now, if the expounder might assume the critic's office, would he express those feelings of admiration and gratitude which the contemplation of such a system—so wise in principle, so beneficent in action—naturally evoke. He will, however, content himself with the statement of one fact, which evidences most conclusively the worth of the law of England. It is eminently adaptive to varying circumstances—not rigidly opposed to change: by the very facility of its own nature, it becomes accommodated to the alterations which changing times and changing manners effect in social relations and their resulting necessities. Owing its existence, not to the skill and sagacity of an individual or an age, but the accretion of the skill and the sagacity of many ages, it has grown with our growth, and strengthened with our strength. Unlike the mushroom constitutions and unsubstantial polities whose seeming merits have deluded our neighbours,—

"'Twas not the hasty product of a day,
But the well-ripened fruit of wise delay."

Ours may be the boast of the Roman statesman—
"Nostra respublica non unius esset ingenio sed multorum; nec una hominis vita sed aliquot constituta seculis et ætatibus; neque cuncta ingenia conlata in unum tantum posse uno tempore providere, ut omnia complecterentur sine rerum usu et vetustate."*

with tolerable clearness, the extent to which jurisprudence has been studied as a science amongst us. The historical school of law, which has become so illustrious on the Continent, has done much towards arresting that wild desire for new laws which spread in France and Germany quite as extensively as it did here. Were the history of our law better known, we should not see amongst the ranks of would-be innovators so many fitted for better things. The history of our judicial procedure tells us plainly that the more you relax strict rules—the less regard you pay to forms, incalculably the more uncertain do you make the administration of the law, and proportionably do you increase the cost and dissatisfaction of the suitor. It is to be regretted that the charge of lawyers' hostility to innovation is not better founded than it is. Cromwell ascribed to their avarice the failure of his endeavours to effect useful law reforms. "The sons of Zeruah," he said, "are too strong for us; and we cannot mention the reformation of the law, but they presently cry out we 'design to destroy property;' whereas the law, as it is now constituted, serves only to maintain the lawyers, and to encourage the rich to oppress the poor" (Ludlow, *Mem.* p. 123). The remarks of Hobbes apply to these bold legislators with peculiar force. "If," he says, "on those matters, on which we speculate for the sake of exercising our genius, any error is introduced, no loss but of our time ensues; but in our meditations which relate to the purposes of life, not only from our error, but our ignorance, necessarily must arise offences, quarrels, and violent deaths" (*Philosophical Elements concerning a Citizen*).

* Cicero, *De Republicâ*, lib. ii. 1.

Law. Procedure in criminal matters. Procedure in Chancery.

Concluding observations.

L A W.

CHAPTER VI.

THE LAW OF SCOTLAND.

Law. Preliminary observations. 286. ON many grounds the Law of Scotland is a system deserving a more detailed and prolonged examination than is consistent with our space. It requires, however, but slight acquaintance with its provisions to discover that it has retained longer than any other system of European law the tokens of its origin, and that it sheds considerable light on the early history of legal institutions, both in England and elsewhere. The importance of the study of laws as a source of historical information has been noticed by one especially qualified to judge in the matter: *Versatur infelicitas quædam inter historicos vel optimos, ut legibus et actis judicialibus non talis commorentur aut si forte diligentiam quandam adhibuerint, tamen ob authenticis longe varient* (*De Augm.* lib. viii. cap. iii. aph. 29). The law of Scotland has a value other than an historical value; and we cannot but admire the wisdom and genius of those venerable magistrates who have successively presided over its administration, and, by their profound knowledge of jurisprudence, have rendered it a system well adapted to the wants and character of a brave and ancient people. There have not been wanting in this age of innovation those who have advised the abolition of this system, as cumbrous and ill adapted to modern times; but, trying such projects by the test which the experience of the last half-century affords us, we may reasonably question the wisdom of any change which should go the length of substituting one system for another, and thus rendering for a period, whose termination is doubtful, the administration of the law perplexing to the judge and uncertain to the suitor. Topical changes—the removal of specific evils—may be easily and safely accomplished by the legislature; and we may leave to the sagacity and experience of the judges, by discountenancing unnecessary refinements, by the power they possess of interpreting doubtful doctrines and perplexed statutes, and by their prætorian functions—their *nobile officium*, to borrow the phrase of Scottish jurists, the task of rendering the theory or scientific *rationale* of the law in every way worthy the progress of the times, and fitted to the varying necessities of the people for whom it exists.

Thus have systems of law been moulded into conformity with successive ages, and such seems the course dictated by experience—an experience fruitful of warning against the rashness of those speculators who, in seeking impracticable objects, would expose to a century of uncertainty and dismay the wealth and property of the country,—

— Tu, nisi ventis
Debes ludibrium, cave.

“Concerning this part of the kingdom,” says Coke, in allusion to Scotland, “there are many things worthy of observation;” amongst which he mentions “that

these two mighty, famous, and ancient kingdoms, viz. England and Scotland, were anciently one” (3 *Inst.* 345),—a fact which is also affirmed in the 1 Jac. I. cap. 1.* The other points of agreement noticed by Coke (*ut sup. cit.*) are the similarity of the religion “and service of God” in both countries, which exists no longer, and the unity of language, government,† and laws. This agreement in the laws of England and Scotland is affirmed by James I., in one of his speeches to the English parliament, in which he observes that “all the law of Scotland for tenures, wards, liveries, and seignores is drawn from England; and James I. of Scotland, being educated in England, brought the English laws in a written hand” (*Works*, p. 523).

* The historical statements contained in laws, and the general truthfulness of their preambles, are usually suspicious enough. See a statement in Alfred's laws (*Anc. Laws and Inst.* p. 26, and Palgrave, *R. and P. Eng. Com.* i. 59; Tac. *De Mor. Germ.* s. xii.); see also 25 Edw. III. st. 1; 3 Hen. VI. cap. 2; 24 Hen. VIII. cap. 12; 31 Hen. VIII. cap. 13; 13 Car. II., printed 1 Madd. *Chan. Prac.* 3; and see also an ordinance of John, king of France, alluded to by Robertson, *Charles V.* vol. i. p. 250. Coke observes “that it cannot be thought that a statute which is made by the authority of the whole realm, as well as of the king and of the lords temporal and spiritual as of all the commons, will recite a thing against the truth” (4 *Inst.* 343). But see the title of the kings of England to Ireland deduced in the Irish Act, 11 Eliz. st. 3, cap. 1.

† This is hardly consistent with the difference, which could scarcely be unknown to Coke, between the manner of legislating in England and Scotland. At the Union, the very constitution of the two parliaments appears to have been different; for in Scotland the parliament consisted of only two estates, although formerly it consisted of three: 1st, the bishops, abbots, and other ecclesiastical persons sitting in right of their sees or benefices, or perhaps in right of their lands held directly from the crown; 2nd, the barons, and commissioners of shires, who were representatives of the smaller barons, free-tenants of the king; 3rd, the burgesses, representatives of the royal burghs. These sat together in one house, having a common president, and all sharing as well in the judicial as in the legislative functions of the parliament. At the commencement of the session a committee was appointed, styled the Lords of the Articles, by whom all bills were prepared; and no bill not approved by them could be discussed in parliament. At first this committee, whose origin dates about the year 1367, was named by the parliament itself; but in course of time it became in fact nominated by the crown, which thus obtained the initiative in all legislative measures. In allusion to this circumstance, and referring to the bills which parliament had to consider, our James I. observed to the English parliament, that in Scotland only such bills as he allowed “are put into the chancellor's hands to be proposed to parliament; and after this, before I put my sceptre to a law, I order what I please to be erased” (*Works*, p. 523). This was felt to be so injurious to the liberties of the people, that of the fifteen articles of grievance presented to William III. the constitution of the Lords of Articles was the first (Burnet, 589), and the committee was accordingly suppressed in 1690. Sir Thomas Craig (*De Feudis*, lib. i. cap. 7, s. 11) considers that in order that a bill should become law, the three estates must have assented to it, the dissent of one estate proving fatal.

Law.

The concordance between the laws is also noticed by Bulstrode Whitelocke (*Commentary on the Writ for choosing Members of Parliament*, vol. ii. p. 272). An opinion seems to have been entertained in early days, that Scotland was indebted to foreign countries for its laws, as appears from the preamble which introduces several old systems of law, and which is so curious in itself that it is worthy of a place here:—

“Because thar wes in that tyme sa many sundry maner of men in Scotland, of divers naciouns and divers conditions, the quilks held ilkan sundry maner of lauwis and consuetuds, that na man stud aw off an uther; and that tyme wes the noble abbay of Dunfermlyn be the said Saint Davy fundit and byggit in the honour of St. Mergarite his moder; in the quilk tym he mad mony castell and abbays and chanounryis, with sundry nouneris, and mayson Dieuwis, that is to say, almis housses, in the honour of God and our Lady suet Saint Mary, and began throu a visoun he met in his slep at Dunfermlyn; than send he after his baronnis and chesit out xxiiii. of the wissast and most hable men to . . . and gert tham be sworn, that they suld passe twa and twa in company togidder over all Cristyyn kynriks and wryt up all the lauwis of ilke land, bath in burcht and in land, and geff tham twa yers space to do this and cum again til hym; and quhen they come agayn thay fand the kyng at the New-castale upon Tyne, makand and biggand the castalle and uthir syndry abbays of blak monks and of quhyt, and of quhyt chanounis and nownerys and maison Diewes, and that he mad and stablest all his lauwis of Scotland, bath in bouch and in land, be hale assent of all his prelatis, lordis, baronis, burgisses, and commouns.”*

This is probably a fiction, copied from the account given by Livy of the embassy sent by the Romans to the Greek cities to procure information respecting their laws (Pomponius, in *Dig.* I. 2, 2, 4). It has, however, been generally thought that the Scotch are much indebted to the English and French education of their king, James I., for the constitution of their tribunals and their forms of process. Their College of Justice they owe to James V., who had seen the merits of a similar institution in France. In the same manner is it highly probable that many of the improvements introduced into our own law in the reign of Henry II. arose from the familiarity with the details of judicial policy the king may be supposed to possess from his office of Grand Seneschal of France and from his general conversance with historical literature (Girald., *Cam. Hib. Exp.* 784).†

The present authority of the law of Scotland rests upon the Act of Union of the two kingdoms. The Union was effected in 1707, and the articles are ratified and confirmed by the 5 Ann. cap. 8. The principal articles of the Union are thus stated by Blackstone:—

1. That on the first of May, 1707, and for ever after,

* Lord Hailes' *Examination of some of the Arguments for the high Antiquity of the Regiam Majestatem*, p. 31 (Edinb. 1769).

† A history of the law of Scotland would be a valuable contribution to European literature. I must be permitted to express my concurrence in the wish stated by Sir Francis Palgrave (*R. and P. Eng. Comm.* i. 480), that the same pen that has already done such justice to the political and social history of Scotland should undertake this task; a task not unworthy the

“Revered defender of beauteous Stuart,”
whose name and reputation his descendants have prolonged.

the kingdoms of England and Scotland shall be united into one kingdom by the name of Great Britain.

Law.

2. That the succession to the monarchy of Great Britain shall be the same as was before settled with regard to that of England.

3. That the United Kingdom shall be represented with one parliament.

4. That there shall be a communication of all rights and privileges between the subjects of both kingdoms, except where it is otherwise agreed.

9. That when England raises 2,000,000*l.* by a land-tax, Scotland shall raise 48,000*l.*

16, 17. That the standards of the coin, of weights, and of measures shall be reduced to those of England throughout the United Kingdom.

18. The laws relating to trade, customs, and the excise shall be the same in Scotland as in England. But all the other laws of Scotland shall remain in force, although alterable by the parliament of Great Britain; yet with this caution, that laws relating to public policy are alterable at the discretion of the parliament; laws relating to private rights are not to be altered, but for the evident utility of the people of Scotland.

22. Sixteen peers are to be chosen to represent the peerage of Scotland in parliament, and forty-five members to sit in the House of Commons. This article is so prefaced as to prevent the crown creating a Scotch peerage with an elective right.

23. The sixteen peers of Scotland are to have all the privileges of parliament; and all peers of Scotland shall be peers of Great Britain, and rank next after those of the same degree in England at the time of the Union, and shall have all the privileges of peers, except sitting in the House of Lords and voting on the trial of a peer (1 *Comm.* 96-7).

The statute 5 Ann. cap. 8, recites two acts of parliament: one of Scotland, whereby the Church of Scotland, and also the four universities of that kingdom, are established for ever, and all succeeding sovereigns at their accession are to take an oath inviolably to maintain the same; the other of England, 5 Ann. cap. 5, whereby the Acts of Uniformity of 13 Eliz. and 13 Car. II. (except as far as the same had been altered by parliament at that time), and all other Acts then in force for the preservation of the Church of England, are declared perpetual; and it is stipulated that every subsequent king or queen shall, at their coronation, take an oath inviolably to maintain the same within England, Ireland, Wales, and the town of Berwick-upon-Tweed. And it is further enacted, that these two Acts “shall for ever be observed as fundamental and essential conditions of the Union.”

Sect. 1.—Sources of the Law of Scotland.

287. The law of Scotland is, like our own, made up of customs, parliamentary and adopted laws, to be studied in reports of judicial decisions, in the records of parliaments, and in authorized text-books. Upon the authority of the Roman or civil law, the Scottish jurists do not quite agree. “Our customs, as they have arisen mainly from equity, so they are also from the civil, canon, and feudal laws, from which the terms, tenors, and forms of them are much borrowed: and therefore these (*especially the civil law*) have great weight with us, namely, in cases where a custom is not yet formed. But none of these have with us the

Sources of
Scottish
law.

Civil law.

Law.

authority of law, and therefore are only received according to their equity and expediency, *secundum bonum et æquum*. * * * But, for the full evidence of the contrary, there is an express and special statute declaring this kingdom subject only to the king's laws, and to no other sovereign's laws" (Lord Stair, *Institutions*, I. 1, 15). An eminent Scottish lawyer, writing subsequently, considers the authority of the Roman law to have been more extensive in its operation. "Although we have collected and adopted a law of our own, which is partly written and partly consuetudinary, yet, as in the infinite variety of cases which daily emerge, some questions will often occur, which by no rule in our law can well be decided, our judges therefore have recourse to the civil law, and are thereby so far governed as they find the rule of decision therein set forth nowise disconform and inconsistent with our own law and practick; and therein the judges are well justified by several acts of parliament, whereby it is declared that the lieges shall be governed by the king's own laws (that is, by our own peculiar laws and customs), and by the common laws of the realm (that is, by the civil law); so that we consider the Roman laws which are not disconform to our own fixed laws and customs, to be our law." He proceeds to give some instances, and concludes—"From all which it manifestly appears that the civil law has all along been considered as our law, and it is justly made the rule of judgment in all cases wherein our law is silent, and when such decisions prove nowise derogatory to our own proper laws and customs" (Bayne's *Disc. R. & P. Laws of Scotland*, p. 166, 1726).*

Abrogation
of statutes
by desue-
tude.

It is a maxim of the civil law, that laws may be abrogated by desuetude. *Ea vero, quæ ipsa sibi quæque civitas constituit, sæpe mutari solent, vel tacito consensu populi, vel alia postea lege lata* (*Inst.* I. 2, 11). The law of Scotland† differs with the law of England, in considering statutes as repealed by desuetude; so that "if a statute after long standing has never been in observance, or, having been, has run into desuetude,

* Dr. Irving, in his *Introduction to the Study of the Civil Law* (p. 108, *et passim*), alludes to the defective knowledge of this system possessed by English lawyers. He has not, however, informed us in what degree matters are better in Scotland, nor favoured us with the names of any Scottish jurists who have contributed to the literature of the civil law anything equalling the celebrated chapter of Gibbon (which has been translated and commented on by Hugo and Warnkönig); the *De Usu et Autoritate Juris Civilis Romanorum* of Dr. Duck, whom Giannone and other civilians styled their Coryphæus, and whose work was reprinted at Leyden and Leipzig; and the *History of the Legal Polity of the Roman State*, by Dr. Bever. "With us now-a-days," observes Professor Wilde, "the authority of this whole law seems in Scotland to be referred to Voet. It is not the *Corpus Juris* itself that is held in estimation; and the authority of this Dutchman is now far beyond any authority of Paulus or Ulpian, or any decision of a Roman emperor, strengthened by all the advice of all the lawyers in his states. In short, the commentaries of Voet are made our Roman law" (*Preliminary Lect. to the Course of Lect. on Inst. of Justinian*, p. 53, edit. 1794).

† The civil law professorships in Scotland appear to have been either more recently established than we might have naturally supposed, or to have been held as sinecures; for Craig, who died in 1608, laments that no public lectures of the civil law were read (*Jus Feud.* p. 14, 1732). James Melville gives the following account of his attending law lectures at St. Andrew's: "In the third and fourth yeirs of my course, at the direction of my father, I hard the commissar Mr. Wilyeam Skein, teatche Cicero *De Legibus*, and diuers partes of the *Institutiones* of Justinian. I was burdet in the housse of a man of law, a verie guid honest man, Andro Greine by nam, who louit me exceiding weill, whase wiff also was an of my mothers [friends]; I am sure

consuetude prevails over the statute till it be renewed either by a succeeding parliament or by a proclamation from the council" (Mackenzie, *Inst.* I. 1, 10). "This power in custom to derogate from prior statutes has been confined by most writers to those concerning private right; and it hath been adjudged once and again, that laws which relate to the public policy cannot fall into disuse by the longest contrary usage" (Erskine, *Inst.* I. 1, 45). "No statute can, however, be repealed by mere non-usage or neglect of the law, though for the greatest length of time; non-usage is but a negative, which cannot constitute custom; there must be some positive act that may discover the intention of the community to repeal it" (*Ib.*). As to what constitutes this state of desuetude, some difference appears to exist among Scottish jurists, some concluding that sixty, and others that a hundred years is necessary thereto. As to the statutes relating to the administration of justice, Lord Stair considers that the authority of the Lords of Session extends "not only to the interpretation of acts of parliament, but to the *derogation*; therefore especially so far as concerns the administration of justice, which is specially committed to them, whereby all old acts of parliament concerning the form of process are in desuetude, and in several points more recent statutes" (*Inst.* I. 1, 16). As, however, from decisions of the Lords of Session, contrary to Lord Stair's opinion, an appeal lies to the House of Lords, this method of abrogating at the mere will of the court exists no longer.

Law.

Sect. 2.—Rights relating to Persons.

288. We will first consider the rights resulting from Marriage; marriage.

Marriage, by the law of Scotland, is constituted by the natural consent of the parties to take each other, from that time forward, for man and wife, but not from a promise to do so at some future time. When, however, such a promise have been followed by actual intercourse, this raises a presumption that, at or immediately previous to such intercourse, a consent, constituting marriage was exchanged. But this is a presumption capable of rebuttal. Parties living together as man and wife are considered as married, unless it be conclusively proved that they never intended marriage, but lived together only to save appearances. This is called a marriage by *habit and repute*. The regular form of celebrating a marriage in Scotland is by the parties appearing before a clergyman, after due proclamation of banns, and notifying their consent to the union, upon which he then declares

how con-
stituted.

sche had nocht sone nor bern sche loued better. This lawier tuk me to the Consistorie with him, whar the commissar wald tak pleasour to schaw ws the practice in the judgment of that quhilk he teatched in the scholles. He was a man of skill and guid conscience in his calling, lernit and diligent in his profession, and tuk delyt in na thing more nor to repeat ower and ower again, to anie schollar that wald ask him, the things he haid bein teatching. Likways my ost Andro acquaintit me with the formes of summons and lybelling of contracts, obligationnes, actes, &c., but my heart was nocht sett that way (*Diary of Mr. James Melville*, p. 23, printed for the Bannatyne Club, 1829). The Scottish lawyers, however, chiefly studied on the Continent, at first in the French, and afterwards the Dutch universities. So general was the practice in early times, that Spalding, alluding to Sandilands, professor first of the canon and afterwards of the civil law in King's College, Aberdeen, observes, that it was not a little "strange to see one man admitted to teach the lawes who was never out of the countrie studeing and learning the lawes" (*Hist. Troubles*, vol. i. p. 179, edit. 1828-9).

Law.

them to be husband and wife.* To constitute a lawful marriage, the consent must be freely given by both parties for the purposes of marriage with each other; and these parties must not be within the forbidden degrees of consanguinity or affinity (which are the same in Scotland and England); and must be of sound mind, capable body, and consenting age, which, according to the Scotch law, is the age of puberty, defined to be fourteen in males, and twelve in females (Stair, *Inst.* I. 4, 6, More's note; 1 Burge, *Comm.* 173).

Dissolu-
tion of a
marriage.

A marriage may be declared void *ab initio* for some cause which subsisted previous to the period it was sought to be contracted (Stair, III. 3, 42), or it may be dissolved by a judicial sentence. This power, unknown to the judicatories of England, is exercised by the Court of Session in Scotland (2 Geo. IV. and 1 Will. IV. cap. 69). The grounds on which it proceeds are either wilful desertion or adultery. The Scotch statute 1573, cap. 55, enacts, "that where any of the spouses shall divert frae the other without sufficient grounds, and shall remain in his or her malicious obstinacy for four years," it shall be competent to the injured party to take proceedings, which, by virtue of the statute, are made the foundations of a divorce. Practice has diminished the four years to one (Lothian, *Consist. Law*, p. 97). In cases of divorce on the ground of adultery, marriage between the committers of the adultery is forbidden (Stair, I. 47). Divorces *à mensâ et thoro* are also granted in cases of cruelty and maltreatment (1 Burge, *Comm.* 635).

Marital
rights.

The effect of a marriage in Scotland is to confer on the husband a power over both the person and the estate of the wife, a power which may be limited by convention, but which, in default of convention, deprives her acts, in dealing even with her own property, of any validity, and nullifies the obligations she might contract if she were unmarried. This is a principle subject to an exception, which includes obligations arising from the wife's delict; but even these obligations have no such operation as would prejudice the husband, unless he have been a party to the delict. Take the example of a pecuniary fine: for this the wife's person cannot be attached, as her coverture pre-

vents her discharging it, nor generally can her property be attached, because her property is equally that of her husband. Unless, therefore, she have property which is exclusively her own, all proceedings against her must be suspended during the subsistence of the marriage. If, however, she has a separate estate, not affected by the *jus mariti*, that may be attached; and that she can herself, by her own acts, charge and burden. She is also liable, though not in her person, for debts contracted after a legal, or even after a voluntary separation, if the husband allows her a proper provision. As a rule, a wife cannot sue or be sued without joining her husband.

The rights arising out of the relation of father and child now claim our attention. Parent
and child.

Children born in wedlock are properly legitimate. The Scotch law appears to be more rigid in its exceptions from the rule already (ch. v. p. 2, s. 3) referred to, *pater est quem nuptiae demonstrant*, as it appears to require proof that access on the part of the husband was physically impossible (1 Burge, *Comm.* 64; Stair, III. 3, 42); and it adopts ten months as the *ultimum tempus gestationis* (*Ib.*). A child born out of wedlock may be legitimated by the subsequent marriage of its parents, it being a presumption of law that the marriage, in fact, preceded the birth. A marriage contracted with another, by either of the parents, subsequently to the birth of the child, or subsisting at the time of its birth, is clearly inconsistent with this legal presumption; and it is the better opinion that, in such a case, legitimation *per subsequens matrimonium* would not take place.* A child so legitimated possesses the same legal rights as one born in lawful wedlock. Legitimacy.

The law of Scotland considers that a father is bound to supply his lawful children with all necessaries, not only during their infancy, or while incapable of earning their livelihood, but also until they are put in some way doing for themselves. It seems, however, from *Maule v. Maule* (June 1, 1825), to be doubtful how far a son, arrived at majority, and bred to a profession, can claim beyond a bare subsistence from his father. Daughters, of such a rank or education as are not qualified to earn their own livelihood, have a claim for necessaries until their marriage. In default of the father, his heir or representative is bound to afford aliment to the children, unless his estate be very narrow, when the mother is bound to contribute. After the father and mother, the obligation devolves on the paternal grandfather, even although the father should be alive, supposing he is unable to discharge this duty. The claim of a son's wife or widow on his father is involved in some difficulty. Parents are not legally bound to educate their children. Rights of
children.

As in England, the father is guardian and administrator in law to his children, being minors (*i. e.*, under twenty-one), and during pupilarity (*i. e.*, under the age of fourteen, if males, of twelve, if females), is entitled to their custody, a right to which, in defect of the appointment of tutors or guardians, the mother succeeds during her widowhood. Children are bound to support their parents when they are incapable of supporting themselves. The father of an illegitimate child (ascertained to be father by presumptive evidence, fortified by the oath of the mother,) is bound to support Rights of
parents.

* "There must be clear evidence that the parties intended to marry each other. Hence the most formal acknowledgment of marriage, even although made *in facie ecclesiae*, will be of no avail, if it shall appear that such was not the true intention of the parties. It may be difficult, often impossible, to show that the parties did not mean to be bound by what they have apparently done, and they will not be permitted lightly to disclaim their own solemn and deliberate proceedings; but still there is no form or ceremony which affords such conclusive evidence of marriage as to make it impossible to show that marriage was not intended by the parties. Such evidence should be received with jealousy, and sifted with rigour; but it is, nevertheless, competent. Accordingly, the most explicit oral or written declarations of marriage, and even the celebration of marriage by a clergyman, have been disregarded, when other circumstances have shown that the parties did not intend to bind themselves by marriage. But where one party has led the other to believe that marriage was intended, such party will not be permitted to plead any secret or reserved intention of keeping free of this contract" (More, notes to Stair's *Inst.* vol. i. p. xiv. ed. 1832). It must be clearly understood that the consent constituting marriage must be a consent *de presenti*, and not *de futuro*, which constitutes only espousals, for the non-completion of which an action of breach of promise lies. In *Graham and Erskine v. Burn*, 2 Jan. 1685, the court awarded to the woman indemnification of actual expenses she had incurred, and also a small sum "for the loss of the market," as Lord Fountainhall expressed it.

* It has been thought that any impediment to the parent's lawful marriage at the time of the child's conception would prevent his legitimation (1 Burge, *Comm.* 95).

Law.

him till he be able to support himself; but the mother is entitled to his custody. A bastard has no power of bequeathing his personal property except he has lawful issue, and can neither nominate executors nor leave legacies; nor can his agnates succeed to him, unless he has obtained *letters of legitimation* from the king, who is otherwise entitled to take. He may, however, convey all his property, real and personal, whether he has lawful issue or not, by a general disposition, provided it be not of a testamentary nature. A bastard, arrived at the age of puberty, may also appoint curators and tutors to his lawful children, &c.

Artificial
relation-
ships:

Tutors,

their spe-
cies.Factor *loco*
tutoris.Office of
tutors.

Curators.

Of the artificial relationships recognised by the law of Scotland, we shall notice that of tutors and curators. "Tutors and curators," says Lord Stair, "succeed in the place of parents, and their obligations have a near resemblance" (I. 6, 1). The tutor acts for the pupil, as the ward is called; and it is his business to protect his pupil, to support and educate him, out of and according to the means of the pupil, and when he attains the age of discretion, to restore to him his own, and yield him an account of his dealings. Tutors are either testamentary, of law, or dative. No one can be a tutor of law who is not a male, nor less than twenty-five years of age; but a tutor testamentary may be appointed and act, if a major, and although a female. Tutors testamentary can be appointed only by the father, who at the time of the appointment was in *liege poustie* (see p. 850, *post*). The tutor of law is the nearest kinsman of the father's side; but if he does not claim the post within a certain time, a tutor dative is appointed by the king in Exchequer; and until such appointment—which, if I do not greatly err, is rarely made in modern times—the Court of Session supplies his place with a factor *loco tutoris*.

The office of a tutor is wholly gratuitous, and his powers extensive. He can direct the education and place of residence of his pupil; subject, however, to the control of the Court of Session; but cannot sell his property, nor alter its nature, nor grant leases beyond the subsistence of his office: he cannot generally allow more for the support of the pupil than the produce of his stock, except where this is insufficient. He is liable for defect of diligence in the management of the pupil's property; and his office expires by his outlawry or death, or by the death of his pupil, by his own removal for malversation, or "as suspect," by the Court of Session (which in some cases interferes to prevent the appointment of a tutor in law), or, in the case of a mother acting as tutrix-testamentary, if she have conducted herself immorally.

Curators are either appointed by the father, in a deed executed in *liege poustie*, or by the minor himself. They differ also from tutors in their office, "in this, that tutors are given chiefly for the pupil's person, but curators are given for the right managing of the goods and affairs; and tutors act for and in the name of their pupils, who in their pupilarity have no discretion; but curators cannot, and are only obliged by their office to authorize their minors, and act with them, by consenting to their deeds" (Stair, I. 6, 33).

Sect. 3.—The Rights relating to Immoveable Property.

289. The rights relating to immoveable property have now to be noticed.

In Scotland, "the property of all lands and immoveables, or hereditaments, is either allodial or feudal"

(Stair, II. 3, 4). Allodial lands are those enjoyed in full possession, and the owner of which has no superior: feudal lands, on the contrary, are those held under a lord. In England we have no allodial lands, since the crown has parted with its patrimonial possessions; and in Scotland all lands are feudal, except as to the king's rights, churches, churchyards, manors, and some lands in Orkney and Zetland.*

In feudal lands there is the *dominium directum*, or superiority; and there is also the *dominium utile*, or right of enjoyment and occupation, which is the ownership of the vassal.† The estate, in respect both of the *dominium directum* and the *dominium utile*, is called

Law.

* These lands are called *udal* lands, and the heritors are subject to a payment styled *skat*. It was a question whether this *skat* was merely a tax or tribute, or whether it was duty payable in *agnitionem dominii*. The Lords of Session, when the matter was before them, considered these *udal* lands to be allodial; and Lord Hailes derived the word from *all* and *od*, signifying *plenum vel absolutum dominium* (Dundas v. Orkney and Shetland heritors, 24 Jan. 1777, 5 Suppl. 609). In the Islandic, *édal* signifies, not only allodial property, but also *res derelicta* (Haldorsonius, *Lexicon Islandicum*, vol. ii. p. 121). Mr. Burge includes, amongst the allodial lands in Scotland, glebes (2 Comm. 237); but glebes and mansees, although they have no express holding, appear to be holden of the king in mortification, as it is called, because they are mortified, "having no other *reddendo* than prayers and supplications" (Stair, II. 3, 39).

By the statute 1633, cap. 10, the superiority or lordship of all church lands is annexed to the crown; and by 1661, cap. 53, the right of vassals of such lands to hold under the lords of erection (as the plunderers of the ancient Scottish church were designated) was asserted, and an option given them of recurring to their position as tenants of the crown, unless they had expressly renounced it. It was also decided that manors and glebes were held of the crown (Fletcher v. Bishop of St. Andrews, 28th March, 1628, 1 Suppl. 258).

† The feudal system, if it ever existed in England, except in legal theory, has now so long disappeared, that it will be interesting to examine slightly its practical details as still subsisting in Scottish law. There the duties of lord and vassal are still held reciprocal. The superior is bound to enter his vassals, when called upon to do so; and if he fail, the statute 1474, cap. 57, renders him liable to lose all the casualties of superiority during the life of the tenant, and who may, for his own security, apply to the over lord for a charter to supply the neglect of his immediate superior. But this applies only to the superior and vassal, and their heirs, and not to their singular successors (assignees or purchasers). These latter can, however, compel the superior to enter them under 20 Geo. II. cap. 50, which specifies in what manner the entering is to be claimed. The superior is also bound to enter the adjudger (one in whose favour has been made an adjudication, "by which all rights of the ground are conveyed from debtors to their creditors, by decree of the Lords" of Session. Stair, IV. 51, 1), or to pay the debt, and come in their place as to the lands; but when the lands have been sold by judicial sale, the superior is bound to enter the purchaser, and cannot insist upon getting the lands at the price agreed to be paid for them. It is competent to the superior to sell or convey his superiority to a third person; but he cannot convey or divide so as either to increase the number of superiors or to interpose a mid-superior between himself and the vassal. The superior is generally entitled to certain feu or blench duties (trifling rents), and to certain advantages on the entering of heirs, purchasers, and creditors. Superiors are often entitled also to personal services; but these have been much affected by the 1 Geo. I. cap. 54, which, in order to carry out the policy of the government of the day, who strove to break down, as far as possible, the system of vassalage, enacted, that the annual sale of the services called personal attendance, hosting, hauling, watching and warding, due by any charter, &c., should be paid in money only, the rate to be ascertained by the Court of Session. The 20 Geo. II. cap. 50, further enacts, that no tacksman (tenant under a lease) should be obliged to perform any services except those expressly enumerated and ascertained by a writing signed by the parties, except mill services. The same act abridges the rights of superiors in many other important instances.

Law. a fee, fief, or feud, and sometimes, though more rarely, a feu. The donee is called the fiar. The fee is simple or taillie.

Fee simple. The fee simple is the estate in virtue of which the fiar is properly proprietor of the lands, which descend to his heirs, and which he may alienate by conveyance or deed in his lifetime. In the grant of such estate, the grantor may burden it with the payment, to him or to another, of a certain sum, which, if in the deed there be clearly stated both the amount of the sum and the name of the creditor, will continue a real charge on the land. The burden, to be real, must be imposed by a clause, either charging the right itself, or making the right null if payment be not made on the day fixed. It is otherwise only personal, and constitutes no real incumbrance on the land, although obligatory on the acceptor of the grant and his heirs. The grantor may also reserve for himself or another a power or faculty to burden the land with debt, provided it be defined in amount, and appears on the record.

Conditions. The fee simple may be burdened with provisions or conditions. If these are impossible or unlawful, "and be conceived as suspensive clauses annexed to the disposition, they annul the same" (Stair, II. 3, 56); but if otherwise, they are merely considered themselves null, as is the case with a provision inconsistent with the right. The estate may be subjected to a condition or clause of pre-emption, giving to the superior the first refusal of the land and to the prohibition to sub-feu. "Its object is not to preserve the superior's influence, but to maintain and render effectual a valuable and pecuniary interest. It is a stipulation that the vassal shall not have it in his power to alienate the fee otherwise than by a conveyance with the proper warrants for holding only of the superior" (2 Burge, *Comm.* 241-2).*

Fee tail; An entail,† tailzied feu, or tailzie, is an estate where

* All clauses *de non alienando sine consensu superiorum* were abolished, in consequence of the rebellion of 1745, by the 20 Geo. II. cap. 50.

† Upon the origin of strict entails, Scottish lawyers appear to be divided. Some held that valid and effectual strict entails could have been made at common law, and that the statute 1685, cap. 22, had no other intention than to regulate entails subsequent to its date. Subsequently it was held, and both these opinions are the bases of judicial decisions, that no entail, whether executed before or after the statute, will be effectual unless it were recorded, and all the transmissions and conveyances thereof regulated by that statute. Thence an inference that at common law no entail was good; an inference broadly stated by Lord Meadowbank, in *Hamilton v. Macdowall* (*Fac. Coll.* p. 326), who held it to be a matter perfectly clear, and declared that arguments urged in favour of the existence of entails at common law, independent of the statute, could not impose, "I do not say on any lawyer, but on any person even moderately skilled in the rudiments of law. I am not speaking," he added, "from my own authority; I speak the unanimous judgment of the court while Lord Justice-Clerk Miller and Lord Braxfield sat on the bench. It was the unanimous opinion of the court, in the case of Agnew of Sheucan, that the case of Stormont was wrong decided, and that entails had not a foot to stand upon, but the statute 1685. They are the mere creatures of that statute." It was the Stormont case, above alluded to, which first affirmed the effect of prohibitory and resolute clauses in so fettering the heir in possession as to prevent any of his deeds affecting the estate (Sandford, *On Entails*, p. 42). This last decision, Lord Kames declared, was obtained by a prevailing attachment to entails, which at that time had the grace of novelty, and were not seen in their proper light (*Law Tracts*, p. 137). Sir George Mackenzie, who was Viscount Stormont's counsel, observes, that because such clauses prejudice creditors and commerce very much, and seem to be inconsistent with the nature of property and dominion, therefore an act of parliament was

the course of descent is according to a special provision—as, to the heirs male, or heirs of male of the fiar's own body, or to the heirs of such a marriage, or to the heirs of Titius, whilks failing, to the heirs of Seius, &c. Of these tailzies there are many several ways, as the fiar pleaseth to invent, and ordinarily in them all the last member or termination is, to heirs whatsoever of the last branch, or person substituted, or the disponent's heirs; and when that takes effect by succession, the fee, which was before tailzied, becomes simple (Stair, II. 3, 43).

The first person taking under the entail is called the institute; the remainder, heirs of entail, tailzie, or substitutes.

Entails may be of four kinds.

(1.) The entail with a simple destination, in which the heirs, as they succeed, are not prohibited from aliening or charging the subject, and which merely amounts to a direction of the course in which the subject is to descend, unless any of the possessors should interfere.

(2.) The entail with prohibitory clauses, prohibits the heir succeeding, according to the form of the prohibitory clause, either generally from doing any act or deed by which the course of descent should be altered, or the lands affected, or, declaring more specifically, that it shall not be lawful to any of the heirs of entail to charge with debts or alienate the property, or to alter the destination. Such prohibitions avail only *inter heredes*; they do not affect third parties. The proprietor cannot convey such an estate gratuitously, but he may do so for onerous causes, and the subject is attachable by creditors. But such an estate raises a *jus crediti* on the part of the substitutes, who, by a process called *inhibition*, may protect themselves against future debts or contracts.

(3.) The third species of entail is an entail guarded with a resolute clause; a resolute clause being a clause declaring that the contravener's right shall be null, by force of which his right to the subject will be forfeited; but his onerous deeds, &c., prior to the forfeiture, are still effectual upon the estate.

(4.) The fourth and strictest entail is an entail with irritant, resolute, and prohibitive clauses, and complying in its constitution with all the requirements of the statute 1685, cap. 22. This statute, as to all entails conformable to its directions, declares the clauses "to be real and effectual, not only against the contraveners and their heirs, but also against the creditors, comprizers,

necessary to secure them (*Inst.* III. 8, 17); and the famous statute 1685, cap. 22, was drawn by him. Mr. More, in his learned notes to Lord Stair's *Institutions*, has clearly shown, that in spite of the assertions already mentioned, of the statutory origin of entails, the courts have still evinced a practical scepticism on the subject. I must be allowed in *alienas segetes falcem inserere*, and to state the substance of his remarks. The statute 1685 imposes certain conditions on the creation of entails as essential to their validity. Clearly an entail not conformable to the requirements of the statute could not operate under the statute; so that where the entail, by reason of its omitting some clauses required by the statute, has been held incomplete, the heir in possession is not barred from aliening, nor can he be restrained in any way from doing so. He is treated, so far, as holding his estate in fee simple; so far, but no farther; for the courts have also decided that he is liable in damages to the substitute heirs in tail, to the degree, at least, of being bound to reinvest for their benefit the price he had received. This appears to rest upon the doctrine that the entail was binding at common law *inter heredes*; but if binding, why were the heirs incapacitated from interdicting, as in ordinary cases, the sale?

Law. adjudgers, and other singular successors whatsoever, whether by legal or conventional titles." The nature of the *resolutive* clause has been already explained; the *irritant* clause goes a good deal farther, inasmuch as it avoids all deeds executed in contravention of the prohibitions of the entail. Both clauses must, however, be inserted, that the benefits of the statute may be enjoyed.

Stat. 1685, The statute requires certain solemnities to be observed as essential to the validity of an entail entitled to the benefit of its provisions. Amongst these are two important requisites: (1) that the authority of the Court of Session should be given to the entail; and, (2) that it be recorded in the register appointed for the purpose.

cap. 22. It has been held that an entailer cannot make a gratuitous settlement of the estate so as to bind himself and exclude his creditors. Lands entailed may be sold to pay the entailer's debts (*see* 6 & 7 Will. IV. cap. 42; 4 Vic. cap. 24).

If a substitute neglects to protect his rights, as by suffering acts of contravention to pass forty years without declaring an irritancy upon them, or if he permit the estate to be enjoyed upon an unlimited title, or upon a title different from the deed of entail, he forfeits his own rights.

That the entailed estate may vest in the substitute, he must serve himself heir to him in whom the fee last vested, unless he succeed under a disposition, which embraces him *nominatim*; and the effect of the general service is to convey every personal right that was in the deceased to the heir.

Construction of strict entails. The prohibitory, resolutive, and irritant clauses, as impeding the free use and circulation of property, are construed very strictly by the common law. The judges, instead of endeavouring to carry out the entailer's intentions, seek for some loophole whereby they may defeat them. "Unless the entailer has by the most apt and explicit terms prohibited alienation, contraction of debt, and alteration of the order of succession, and guarded his prohibitions by the proper resolutive and irritant clauses, no effect whatsoever will be given to his obvious meaning, and no inference, however plain, will be permitted to supply the place of the direct words which have been held essential for this purpose; and hence, though there should be the most express prohibition against altering or changing the order of succession appointed by the deed, this will not prevent the heir in possession from selling the estate, and conveying it to a stranger, and thus defeating the entail by carrying it off to a new set of successors. Nor will a prohibition against selling the estate, so that it may descend in perpetuity to the heirs appointed by the deed, bar the heir in possession from gratuitously conveying it to strangers, and altering the order of succession. Nor will a prohibition to contract debt upon the estate, whereby it may be adjudged [taken upon process] by creditors, and carried off from the appointed series of heirs, be inferred by the most express and cautious clauses for preserving the estate under the entail, and for its descent to the substitutes called by the deed: and so far has this rigid species of construction been carried, that even though the prohibitory clauses should be expressed in the most apt and correct terms, yet, if there be any defect in the resolutive or irritant clauses, the entail will have no more effect against creditors and third parties than it would have had if the prohibitory clause which is not

properly guarded by the resolutive and irritant clauses had been omitted" (More, note, Stair, *Inst.* 183).

Law. An entail is a fee, although limited and restrained; and the heir of entail is a *fiar* unlimited, except as to particular points. It is then clear that all the incidents of an estate in fee simple belong to an entail, not inconsistent with its nature as an entail. Thus, upon an entail, unless it have been specially provided otherwise, attach the widow's *terce*, and the widower's *courtesy*. The tenant is entitled to cut down timber, but probably not young trees, when the cutting is manifestly injurious to the estate. If a mansion be specially included in the deed of entail, it is not competent to the heir to pull it down in order to sell the materials. A heir of entail is *personally* liable for debts due by the entailer; but if he pays them, he is entitled to keep them up as charges upon the estate entailed. By the 10 Geo. III. cap. 51, succeeding heirs of entail are liable to the extent of three-fourths of the sum laid out by a preceding heir in buildings and improvements, proper notice having been given of the same. The 20 Geo. II. cap. 50, empowers heirs of entail to sell the superiorities of entailed estates to their vassals, under conditions therein prescribed; and, by various subsequent statutes, powers are conferred, or burdens imposed, upon such heirs, who are enabled, it should be further remarked, to grant provisions of a certain amount to their wives, husbands, or children, payable out of the rents of the entailed estates, notwithstanding the terms of the deed of entail (5 Geo. IV. cap. 87).

Another species of estate is that of a conjunct fee and life-rent—a very singular modification of interest in property, but which may be thus explained. If the grantees are strangers, the conjunct fee would be considered as giving to the survivor the whole benefit of the subject; and after his death, the fee divides equally between the heirs of both. If the right be taken to two jointly, and their heirs, without any mention of life-rent, the conjunct heirs enjoy the subject equally while both alive; but on the death of one, then his share of fee and life-rent descends to his heirs, instead of accruing to the survivor. If the grantees be husband and wife, unless the infestment expresses it to be to the longest liver, and unless the right be originally derived from the wife, and a life-rent only was intended to be reserved to the husband, he is sole *fiar*, and she possesses nothing but a life-rent.

We have treated of rights to the dominion; we shall now briefly consider those real rights which exist apart from the dominion, which are burdens on land; and first, of servitudes, personal and real.

Personal servitudes are those whereby the property of one is subservient to the person of another than the *fiar*. Servitudes personal for time of life are called *life-rents*, of which we shall now speak. This life-rent is a usufructuary interest, and to it is applicable the definition of usufruct given in the *Institutions*—*jus alienis rebus utendi fruendi, salva rerum substantiâ* (II. 4, 1). It is called a personal servitude, in reference to the usufructuary, he retaining his lien on the property by whomever enjoyed, and it ceases on his own death; but it may be considered as a real servitude, as binding, not the person, but the land, by whomever possessed. Life-rents are *legal* or *conventional*. Legal life-rents are the results of the operation of law. The *terce* of the widow, and the *courtesy* of the widower, are examples.

- Law.** I. Unless a special contract between the parties exist to the contrary, the wife is entitled to a life-rent of a third of the heritable subjects in which her husband dies infest. This is called her *terce*, and she the *tercer*. If a special provision have been granted by the husband to the wife, she is excluded from the *terce*, unless it appears to have been intended that she should have both.
- Terce.**
- Service.** In order to receive her third of the rents by virtue of the *terce*, the widow must be *served* to it. A brief or writ is obtained from the Chancery, directed to the sheriff of the county where the lands lie, who summonses a jury of fifteen men, who are sworn to inquire—
- Kenning.** (1) whether the widow was lawful wife to the deceased; (2) whether the husband died seised of the lands in question. When served, the widow may sue tenants for the third of the rents, and possess the land *pro indiviso* jointly with the heir; but she can exercise no other authority until the sheriff *ken* her to her *terce* by dividing the land between the heir and her. The *terce* is excluded—(1) by a decree declaring the nullity of the marriage; (2) by the dissolution of marriage before a year and a day, without issue; (3) by the wife's adultery or wilful desertion.
- Courtesy of Scotland.** II. By the courtesy of Scotland, the husband is entitled, after his wife's death, to a life-rent of all real property inherited by her, and whereof she was infest, if there was a child of the marriage born alive, capable of having been heir to the wife. The theory of law considers him as entitled less as husband of the heiress than as father of the heir. The liabilities of *tercer* and tenant by the courtesy materially differ: the former is in no degree affected by her husband's debts; but the latter, as he enjoys the life-rent of his wife's whole heritage under a lucrative title, is considered as her temporary representative, and is liable to the payment, not only of all the yearly burdens charged on the subject, but of the current interest even of personal debts, while his right subsists, to the extent of the benefit he enjoys by the courtesy (1 Burge, *Comm.* 429).
- Conventional life-rent.** Conventional life-rent arises from reservation or grant. In the former case, the owner, in transferring the fee to another, reserves the use and enjoyment of it to himself; in the latter case, it is constituted by deed of conveyance, and with all the solemnities observable in passing the fee.
- Real servitudes;** Real servitudes are of less importance, and may, agreeably to the classification of the *Digest* (L. 16, 198), be considered as *urban*, which include those constituted in favour of houses or buildings, whether situate in city or country, or as *rural* or *prædial*, which include those having relation to farms, fields, or gardens.
- Support.** (1.) The servitude of *support* "whereby the servient tenement is liable to bear any burden for the use of the dominant" (Stair, II. 7, 6). This combines the *onus ferendi* (whereby the wall or pillar of one house is bound to sustain the weight of the buildings of the neighbour), and the *tigni immittendi* (which is the right of inserting a joist or beam from the wall of one house to another, that the latter may bear the weight), known to the Roman law.
- Stillicidium.** (2.) *Stillicidium* is the rain-water running from the roof or eaves of a house by drops, and which, when collected in a spout, is called *flumen*. Except by a servitude of this kind, no one can build so as to expose his neighbour to this annoyance.
- Light or prospect.** (3.) Servitudes of *light* or *prospect* are restrictions upon natural liberty, to the effect of preventing the servient proprietor from raising obstructions to the light or prospect of the dominant tenement.
- Law.** Such are the principal urban servitudes. The *rural* are chiefly as follow:—
- (1.) Ways or roads, being horse-roads, foot-roads, cart ways or coach roads or ways, or loanings, whereby cattle roads may be driven from one field to another.
- (2.) The servitude of *aquæductus* confers the right of *Aquæduc-* guiding water through, and by dams gathering water *tus* upon, another's ground, for one's own use, care being taken to keep the waters from injuring the servient tenement.
- (3.) *Aquæhaustus* enables a landholder to water his *Aquæhaus-* estate at any river, brook, well, or pond, in his neigh- *tus* bour's grounds. The law upon this subject contains a variety of provisions for the protection of the various parties interested, which we shall not attempt to detail.
- (4.) The servitude of *feal* and *divot*, which authorizes *Feal and* one to take feals or divots (green turf used for hedging *divot* or thatching) from the surface of the servient tenement, for the purpose of thatching.
- (5.) The servitude of *feal* is a right of raising turfs or *Feal* peats for the purposes of the dominant tenement.
- (6.) The servitude of *thirlage* restricts the inhabi- *Thirlage* tants of certain lands to the use of a particular mill. There are various duties involved in this servitude, to which a detailed allusion is not necessary.
- We shall now consider those real rights which result *Heritable securities.* from heritable securities.
- Heritable securities* are various in their kinds. There *Wadset:* is the *wadset*, by which the debtor conveys the land to the creditor, to be enjoyed by him until the debt be repaid; the form of which is an absolute conveyance, and a separate instrument contains the clause of *reversion*, on payment at a certain time and place; and also a clause of *requisition*, enabling the debtor to quit possession, and recover his debt. A *wadset* may be *proper* or *improper*, the chief distinction *its species.* between the two being, that, under the first, the *wad-* setter (mortgagee in possession) enjoys the rents and profits of the lands, as his recompence for the loan; while in the second place he receives them, and, if deficient, looks to the reverser or debtor to make up the deficiency; but if they exceed his interest, is bound to account for them in discharge of the principal; and when his receipts equal that and the interest, he is bound to divest himself in favour of the reverser. The debt may be discharged by either party; by the one under the clause of *reversion*, by the other under the clause of *requisition*. The *reversion* is a real right, descending to the heir.
- The chief heritable security for debt, however, was *Heritable bonds.* originally in form a rent-charge; it is now what is called a *heritable bond*, which obliges the debtor to infest the creditor* in the lands (that is, to convey them to him in fee), for securing the principal, interest, and penalty; and he assigns the whole rents during the non-redemption. The creditor may enter into immediate possession, and his rights are terminated by his recovering the debt or by its being paid to him.
- Scottish conveyancers prefer to this, the *bond and* *Bond and disposition in security.* disposition in security.
- * This contemplates the case of a creditor only. But a heritable bond may be granted to a cautioner (one who is surety for another), as a security to him, when it is styled an infestment of relief. In this case the infestment is conditional, and does not operate until the cautioner pay the debt, or be proceeded against for its payment.

Law.

Law.
Absolute
disposition
and back
bond.

disposition in security, which besides giving the creditor a right to the lands, empowers him to sell them in discharge of his advances. The last species of heritable security is an *absolute disposition*, with a *back bond*; the first of which appears to constitute the creditor, owner of the lands absolutely; whilst he declares, in the latter, that they had been disposed him in security, and promises to divest himself of all right to them on payment. He is, at the same time, protected by the clause, empowering him to sell, and in the meantime receives the rents in payment of his debt and interest. This security requires no re-conveyance of the lands.

Bonds carrying interest.

Bonds conditioned for the payment of money, although not secured on land, provided they carry interest, may be either heritable or moveable, according to circumstances. They are heritable always, if in express terms they exclude the executors of the creditors from taking, or, if they contain a clause of infestment, because such discovers "the creditor's intention to constitute with his money a feudal right on land" (2 Burge, *Comm.* 37). Otherwise such bonds are moveable as to the succession,—that is, descend to the children and next of kin; but as to the reciprocal rights of husband and wife, see sect. 4, *post*; and the right of the crown or fisc (see p. 848, *post*) are heritable.

Rights having a tract of future time.

Rights having a tract of future time, as it is expressed, that is, rights to payments future and periodical, by their essential constitution are considered as heritable, and descend to the heir. These rights are not the less heritable, because affecting property of a personal nature, and not charged upon land. It must, however, be understood, that a debt is not considered as having a tract of future time, merely because the term of payment is postponed, or because it is payable in instalments, even although interest be payable in the interim; and the reason of this is, that the debt vests absolutely from the first, and there is "a mere delay of payment granted to the debtor; and it makes no difference, as to this question, whether such delay be granted to one term only, or to several terms" (More, note, *Stair, Inst.* 142).

Annuities.

A right of annuity is an example of a right having a tract of future time, for the right to receive the successive annual sums vests only as the time for payment elapses. Upon the heir, therefore, descends this right, its profits or its burdens. A right to *rents* is another example. *Offices*, granted to continue after the death of the patentee, are heritable, descending to the heir.

Rents.
Offices

Trust estates.

Another burden upon real property arises when an estate is conveyed, and the deed, and the formal documents passing the estate, express it to be a disposition in trust, and these are recorded: then is a *jus crediti* created on behalf of the person to whose use the trusts exist, which is a real burden on the estate.

Feu-farm.

Another species of real right is that arising from lands in *feu-farm*, which are lands, granted upon the terms of paying or delivering to the superior a fixed yearly rent, in money or grain, or by the performance of certain services proper to a farm, as ploughing, sowing, &c. The grant in feu-farm resembles the emphyteusis of the civil law, from which it is supposed to be derived, and gives to the tenant a *jus dominio proximum*, and full right to cultivate the land as he pleases, and to receive its profits, and subject it to the burden of his debts. The restrictions upon alienation, are, practically, very slight.

Tacks.

By the jurisprudence of most countries, a lease is

considered as a personal contract between the landlord and tenant, and the rights devolving on the tenant descend in the same manner as all other personal property; and such, we are told, was originally the case in the law of Scotland; but such has been the effect of a statute (1449, cap. 18), that tacks, as leases are called, have become real rights, descendible to the heirs. Tacks must properly be in writing, if to subsist for more than a year; but if the tacksman, on the faith of his lease, have made *extensive* improvements, or similar *rei interventus* have taken place, the rule is relaxed. An obligation in writing to grant a tack, if followed by possession, is equivalent to a tack, and is binding on the obligor and his singular successors. It is the *possession* which constitutes the tack a real right, and seisin is not necessary.

Having considered the various modifications of Titles to interest in real property recognised by the law of estates. Scotland, we now inquire in what manner it may be transferred and acquired. This may be done either by simple operation of law or by the act of parties.

(I.) *Succession ab intestato*, or descent, as it is called in the law of England, is regulated by rules which vary according as the fee has been inherited or acquired—is, to use the technical phrase, a fee of *heritage* or a fee of *conquest*. Those acquiring by conquest are called heirs of conquest; although they may be heirs of line; but the heirs of line retain their name, in distinction to heirs of conquest.

First, then, as to heirs of line, who are—(1.) The Heirs of lawful issue of him who died last seised, the males* line. being preferred, and each taking in succession according to seniority, and the children, representing deceased parents, taking in their room. Failing males and their issue, the female issue inherit *pro indiviso* as heirs portioners, the issue of such females, as predeceased, taking their mother's portion. The eldest heir portioner by legal succession has a right to the mansion-house and the grounds on which it stands, to such peerages, dignities and titles as are not limited otherwise, and to subjects indivisible, such as superiorities. (2.) Failing children, grandchildren, and their descendants, resort is had to collaterals. On the death of a middle brother, his younger brothers (and their issue) succeed in the order of seniority, and elder brothers succeeding to younger are, with their issue, preferred in an inverse order—from younger to elder upwards. The brothers and their issue succeed to a sister, in preference to her sisters. (3.) The whole blood is preferred to the half-blood consanguineous; but the half-blood uterine† is wholly excluded. If the half-blood taking be the issue of a former marriage, the youngest brother is preferred; and after him (failing his issue) the next youngest, the opposite rule holding if the half-blood be of a subsequent marriage. Failing collaterals, the father and his relations inherit; but the succession never ascends to the mother, nor (even although the estate have been her own, if it has vested in her son or daughter,) do her relations ever take.

In failure of the three lines of succession enume-

* Lord Stair mentions John Campbell of Skeldon succeeding to his father in a ward-fee, being the seventeenth son (II. 4, 44).

† Relations are consanguineous when born or descended from the same father; uterine, when born or descended from the same mother. On the subject of collateral consanguinity, see an excellent tract by Blackstone, in his *Tracts*, vol. i. p. 11. Oxford, 1761.

Law. rated—the descending, collateral, and ascending lines—the king takes by a caducary right, and not a right of succession, although he is styled *ultimus hæres*.

Heirs of conquest. Secondly, as to heirs of conquest. "Succession to conquest, as contradistinguished from succession to heritage, takes place only where a middle brother or sister (or their issue) dies, leaving younger or elder brothers or uncles. The younger brother (or uncle) and his issue take the heritages; the elder and his issue, the conquest" (4 Burge, *Comm.* 89–90).

Prescription positive; (II.) By prescription, positive or negative. Positive prescription arises when one has possessed, peaceably and without lawful interruption, his lands, annual rents or other heritages, heritable rights and privileges, servitudes or other real burdens, by himself or others, in virtue of feftment for the space of forty years subsequent to their date, or so far back as memory can reach; he shall not be troubled or disquieted. Negative prescription is the result of a forfeiture of a right, through the proprietor's neglect to exercise it for forty years. Rights, thus prescribed against, are not only moveable rights, and arise out of simple obligations, but rights of action on heritable bonds, reversions, &c. The effect of this prescription is to extinguish all claims that have been allowed to lie over without being made or insisted on for forty years after they were enforceable; and it is founded on the presumption, common to other systems of jurisprudence, either that such claims have been satisfied, or that the creditor has relinquished them.

negative. We shall now consider the method of acquisition by the act of the parties.

Charters. To the constitution of a valid conveyance of a fee there are two requisites—a writing containing a present dispositive act, with a direction that seisin should be delivered, and a delivery of seisin as directed. This writing is usually styled a charter; but no precise form is necessary, and it may be a charter only in fiction of law: thus a precept of seisin, as the direction above mentioned is technically called, may be only a disposition with a clause obliging the grantor to sign a charter. So long, in fact, as the disposing will is evinced, the first requisite of the law is complied with. Charters granted by subjects are either *à me* or *de me*: in the first, the holding is, not of the grantor, but of his superior, whose confirmation is necessary to make the holding valid; the second reserves the superiority to the disponent. Charters are also either *original* or *in progress*, *voluntary* or *necessary*.

original; A charter is said to be *original* when it is creative of a fee *de novo*; all its provisions are understood in subsequent charters, all whose ambiguous provisions are interpreted by it. A charter *in progress* disposes of a fee already in existence; as, for example, a charter from a superior to the heir of his vassal; or by a vassal to another, to be holden of his superior.

voluntary; A *voluntary* charter is granted by a superior *ex mero motu*.

necessary. A *necessary* charter he grants in obedience to law; as when a creditor by process has obtained a right to his debtor's lands, the superior is bound to give him charter and seisin.

A charter contains—

(1.) The name and titles of the party granting.

(2.) A recital of the causes of the grant, which may be either *onerous*, or *gratuitous*, if made for love and favour. "We follow not," says Lord Stair, "that sub-

Law. tilty of annulling deeds because they are *sine causâ*; but do esteem them as gratuitous donations; and therefore narratives expressing the cause of the disposition are never inquired into" (II. 3, 14).

(3.) The dispositive clause of a charter describes the nature and boundaries of the subjects conveyed, and expresses the order of succession and limitation of the fee.

(4.) The clause of *tenendas* (the *tenendum* of English lawyers) states the tenure by which the lands are to be holden.

(5.) The clause of *reddendo* expresses the duties or services to be yielded, and which, from this circumstance, are themselves called the *reddendo*.

(6.) The clause of warrandice, or warranty, whereby the grantor binds himself to the validity of the right conveyed.

(7.) The precept, or letter of seisin, being a direction from the superior to his baillie to give seisin or possession to the vassal or his attorney, by delivering to him the proper symbols.

The precept is executed by what is termed an *instrument of seisin*, which is in effect an attestation of a notary that possession was truly given by the superior or his baillie, to the vassal or his attorney, by the delivery of the proper symbols, according to the precept. These symbols are—for lands, earth and stone; for annual rent out of land, the same, with the addition of a penny-money; for parsonage tithes, a sheaf of corn of the church; for jurisdictions, the book of the court; for patronages, a psalm-book and the keys of the church; for fishings, net and coble; for mills, clap and hopper, &c. This seisin ought to be taken on the lands contained in the precept—a rule which, under special circumstances, may be dispensed with.* The legislature

* This was done in the case of the grant of Canada and Nova Scotia, by James I. to Alexander the Earl of Stirling, whom he styled "my philosophical poet." The seisin, by the king's direction, was taken at the gate of the Castle of Edinburgh, and afterwards confirmed by act of parliament, 1653, cap. 28. The usual form in which seisin was delivered is thus stated by Mr. Burge:—

"First, either the vassal or his attorney appears on the lands of which seisin is to be given, holding in his hand the precept, which he delivers to the superior, or in his absence to the baillie. The baillie immediately delivers it, in the presence of witnesses, to the notary, who is to extend the instrument. Then the notary reads the precept; after which the superior, or his baillie, delivers to the vassal, or his attorney, earth and stone of the lands, or the other proper symbols, if the right granted be not a right of property in lands. Lastly, the vassal, by himself or his attorney, takes the instruments in the hands of the notary before witnesses that he hath received state and seisin of the lands in due form. On the whole of this transaction an instrument is extended in writing by the notary, who, after reciting in it the precept of seisin, and as much of the charter as is necessary for understanding the precept, subjoins his own attestation, that he, having been specially called for the purpose, knew, saw, and heard that these facts were so done as they are recited in the instrument, to which he and the witnesses adhibit their subscriptions" (2 *Com.* 729).

In ancient times it was the delivery of seisin that constituted the transfer, and the charter was only the evidence of the seisin. "Amongst savage nations, the want of letters is imperfectly supplied by the use of visible signs, which awaken attention and perpetuate the remembrance of any public or private transaction" (Gibbon, *Decl. and Fall*, ch. 44). Under the Roman law, the absolute right of property was called *mancipium*, *jus Quiritium*, probably from the *mancipatio*, which was one of those modes (*modi adquirendi civiles*) pointed out for its acquisition. This *mancipatio* was nothing but the solemn delivering over of the thing in the presence of a determinate number of witnesses and a public officer (*Cod. Theod.* VIII. 12, 1, 2, & 8; and Warkönig's note on Gibbon, chap. 44, Milman's edit. vol. viii. pp. 82–3).

Law.

has interfered most materially with the feudal character of Scottish law, rendering the vassal, to all intents and purposes, the absolute proprietor of the fee. At first, it was competent to the superior to object to receive any vassal other than the heir of the vassal named in the investiture; but as the law now stands, he must receive creditors, appraisers or adjudgers (acting under legal process), the purchasers of a bankrupt's estate, upon payment of one year's rent, and all singular successors (as those are called who appear in any other character than heirs)—they having obtained from the vassal a disposition containing a procuratory of resignation, as it is called, and also yielding to the superior the fees or casualties he is entitled to on the vassal's entry—a year's rent (Stat. 1469, cap. 37; 1672, cap. 19; 1681, cap. 17; 1690, cap. 20; 20 Geo. II. cap. 50, s. 12).

Confirmation of the superior.

Where the lands are disposed to be held of the disponent, the confirmation of the superior is not necessary, except as a matter of prudence to protect the disponent from the disponent's defaults in respect of his superior.

Where the disposition is to be holden of the disponent's superior, it may be perfected by either confirmation or resignation.

(1.) The first case, as the superior admits the disponent (who has already taken seisin on a precept contained in the disposition) by a confirmation, written on a separate charter, reciting the charter confirmed.

Resignation.

(2.) By resignation, the vassal surrenders his fee to the superior, in whom (if the resignation be *ad perpetuam remanentiam*) the property, as well as the superiority, in consequence, vests, or (if it be *in favorem*) he receives it to deliver it again to a third party specified. The form of resignation is properly this: the vassal surrendering, on bended knee, delivers the symbol of staff and baton into the hands of the superior, who, in the case of a resignation *in favorem*, immediately delivers it to the disponent, and a notarial act, recording the ceremony, completes the transfer. In practice, a *pen* is the symbol actually delivered.

The *dominium utile*, or right of enjoyment, distinguished from the proprietorship, passed by the delivery of a symbol on the spot (Spence, *Inquiry*, 32).

Sir Francis Palgrave has collected some interesting examples of this conveyance of property by means of symbols. St. Birlanda refused to associate with Oidelardus, her leprous father, who disinherited her, and conveyed all his domains and villans to St. Gertrude, by placing on the shrine of that saint a turf, a twig, and a knife. This transaction took place in the reign of Dagobert. When Tassilo, the duke of the Bavarians, submitted to Charlemagne, and renewed his vassalage, he surrendered his dominions by delivering a staff, at the head of which was the image of a man. According to Kofod Ancher, the ceremony called "Skjodning" was, amongst the Danes, the only mode of transferring property. A turf or clod was cast, or "shot," by the grantor into the cloak or hood of the grantee; and it could only be done in full court or a place of equal publicity. It was by delivering a small silver sword that Culen, the Scoto-Pictish king, gave investiture to Gillespie Moir (A. D. 965) (*R. and P. Eng. Comm.* i. 141; ii. 227). It is related that when William the Conqueror landed at Pevensey Bay, he stumbled and fell on his hands. His superstitious troops loudly exclaimed, "*Mal signe est çui!*" "No," replied the duke, recovering himself, and raising one of his hands, which held a clod of earth, "I have taken seisin of the country." Similar presence of mind has been ascribed to Camillus (Plut. *Vit.* t. i. p. 214, edit. Schæfer, 1826). It is singular to observe that the distinction observed by the Romans, between the mode of passing the dominion and the usufructuary estate, should have been observed by the barbarians. This latter was conveyed in England by the delivery of a rod or branch of the tree; in Scotland, of a straw; and in the Belgic districts, of a staff.

Every obligation relating to heritable rights must be—(1) in writing; (2) signed (personally, or, in the case of illiterates, by a notary) and witnessed; and (3) in obligations of great importance (understood to be obligations granted for a consideration exceeding in value 100*l.* Scots), subscribed or sealed by the grantor (or, in the event of his being illiterate, by two notaries), before four witnesses particularly described. All original charters, contracts, and others whatever, not mentioning the name, dwelling-place, or other denomination of the writer, are null. All deeds destitute of the required solemnities "shall bear no faith in judgment, or shall be null, and not suppleable by any condescendence;" and cannot therefore be produced in evidence against the grantor, nor be supported by any proof whatever. Exceptions to this principle are too trifling to require notice.

Law. Requisites of transfers, &c.

Another method of transferring property is by act *Apprizings*.

of the parties uniting with the operation of the law, as when lands are taken in execution by a creditor. By a very ancient statute (Stat. Alex. II. cap. 24) it was provided, that if the debtor had no moveables, the sheriff should give him notice to sell his lands, which if he did not do, they were transferred to the creditor in discharge of his debt. The statute 1469, cap. 36, gave the debtor a power of redemption within seven years. The creditor taking is called the *apprizer*; the transference was accomplished by *letters of apprizing*, and which were founded upon a judgment of the Court of Session.

The excess of the rents, after payment of the interest of his debt, the apprizer received in part discharge of that debt; and all apprizers' apprizings, *led* within a year of the first effectual apprizing, placed the subsequent apprizers on the same footing as if the first apprizer had *led* for them all. Apprizings were formerly the chief executorial, or processes chiefly used to enforce judgments, whereby all rights of the ground were conveyed; but now *adjudications* are the executorial *Adjudications* chiefly in use; and by them all rights of the ground are conveyed from debtors to their creditors by decret of the Lords of the Session, and which pass as effectually and fully as they could do by voluntary disposition; except in the former there are no clauses of warrandice, which are always contained in the latter. There are their forms; two forms of adjudication under the statute 1672; one is called the *special*, the other the *general* adjudication. The special adjudication was where debtor special; and creditor concurred in an amicable action; in which the former showed his title, concurred in proceedings ascertaining the value of the lands, and in setting off a portion to be adjudged to the creditor equivalent to his debt, and one-fifth more, subject to redemption within five years. The general adjudication embraced all the debtor's general lands and real rights, which it passed to his creditor, subject to redemption in ten years. If the debtor did not concur, as required in the special adjudication (and this is the usual practice), the general adjudication proceeded. The alternative is offered to him. The debtor is, in practice, able to redeem after the term fixed by law, until "a decree of declarator of expiry of the legal" has been obtained, which is the nature of our decrees of foreclosure pronounced by the Court of Chancery. To authorize an adjudication, the debt or obligation, on account of which it is used, must be regularly constituted, either by the decree of a competent court, or by a signed document, such as a bond, bill, or other obligation in writing, determining the

Law.

precise amount and character of the debt. An adjudication followed by charter and seisin, and forty years' possession after the expiry of the legal time for redemption, constitutes an indefeasible title to land.

Judicial sales.

The 54 Geo. III. cap. 137, enacts that a judicial sale, at the instance of creditors, may in all cases proceed where the interest of the debts and the other annual burdens exceed the yearly income of the subjects under sale, or where a sequestration shall have taken place under this statute, without any other proof of bankruptcy or insolvency. A sale at the instance of creditors is authorized by the action of judicial sale and ranking, which enables a creditor holding a real security on an insolvent estate, to sell the same, and to have the price; and an apparent heir (that is, an heir who had not perfected his title by entry) might bring it to sale, whether the estate was insolvent or not. It is only after having adjudged, that a creditor can raise an action of ranking and sale, and the creditor selling must be in possession of the estate. The title of the purchaser under such sale is protected against the claims of the debtor, and those deriving right from him, against all claims of his creditors, but not against the claims of third persons whose rights are not derived from the bankrupt, but may prove to be preferable to his.

Judicial sale and ranking.

In concluding this rapid survey of the law of Scotland as respects *real property*, it will be proper to allude to some of its more remarkable characteristics.

Testament. (I.) It may be observed, in the first place, that heritage or real property is not capable of disposition by testament. If the instrument in which such a disposition is attempted is clearly intended to be testamentary, then, so far as it disposes of heritable property, is it held void. The principle of law goes so far as to invalidate all dispositions transferring or burdening heritable property to the prejudice of the heir, if executed by one during a sickness whereof he dies, unless he survive the execution sixty days, or after the execution go to kirk or market unsupported. Hence the distinction, so well known to Scotch lawyers, of *death-bed* and *liege poustie**—the technical terms indicating two states of competency and incompetency to burden or dispose of an estate to the prejudice of the lawful heir. "When an overture was made in the parliament (1672) to allow heritors to burden their estates with three or four years' rents on death-bed, providing for younger children, the motion was rejected, as tending to destroy the ancient families of the nation" (Lord Fountainhall, II. 325).

Death-bed and liege poustie.

* A man is in *liege poustie* when he is in the posture of a liege able to serve his lord in the war, like Chaucer's knight, of whom he says,

"Ful worthy was he in his lord's werre."

The decisions on this subject are very curious. It would appear that, formerly, deeds executed by a person while labouring under a disease of which he ultimately died, were void, unless he had given proof of his convalescence by going to kirk or market unsupported. Nor would this avail to rebut the presumption that the deeds were made *ex capite lecti*, as it was called, unless he went to kirk or market in the daytime; if to the kirk or kirkyard, then at a time when people are gathered together there for any public meeting, civil or ecclesiastic; or if to the market, then at market time. It appears doubtful if going to a dissenting chapel would equally avail. The ground of this doctrine of avoiding does not appear to be, that the party executing was afflicted with a *morbis santicus*, or disease affecting the whole body and brain; for it did not appear sufficient, in the case of a disposition of Lord Balmerino in favour of Lady Couper, to show that after it was made "my lord made bargains and counts, seemed to be merry and laughed,

(II.) For an heir to perfect his title to his predecessor's estate, he must (except in a few cases) enter, either by precept of *clare constat*, or by service and retour. The first method of entry is so called from the initial words of the precept, *Quia mihi clare constat*, &c., by which the superior acknowledges that the defunct died last vest and seised in such lands and annual rents, that the same are holden of him by such a tenure, and that the obtainer of the precept is nearest and lawful heir to the defunct in the said lands; that he is of lawful age for entering thereto, and therefore commands his bailiff to infest him therein. The doctrine of entry by service and retour is very complicated, and gives rise to many questions, which are unnecessary to be discussed here. The form is simply this. A brieve or writ is obtained from the Chancery, addressed to the judge ordinary where the land or annual rent lies, such as the sheriff, steward, baillie of royalty or regality, or baillie of burgh-royal, directing him to inquire by a jury or inquest (consisting usually of fifteen persons), publicly summoned, "who died last vest and seised as of fee in such lands or annual rents, and if in the faith or peace of our sovereign lord, and who is his nearest and lawful heir therein, of whom it is holden in chief, by what service, and what the value of it is now and in time of peace, and if the said heir be of lawful age; in whose hands the same now is, from what time, how, and what service, by whom, and through what cause" (Stair, III. 5, 28). The service is the sentence or decret of the inquest, signed by their chancellor, and also authorized by the signature of the presiding judge, and so returned into Chancery, where it is registered, whence it is called a *retour*. The Court of Session may, however, annul it, if its correctness be impeached.

Law.

Clare constat.

Service and retour.

(III.) We must also notice the system of registering deeds which obtains in Scotland. By an Act, 1617, cap. 16, all reversions, regresses, and bonds for making reversions and regresses, assignations and discharges thereof, renunciations of wadsets, grants of redemption, and instruments of seisin, were required to be registered within sixty days after their dates. The registration may be effected either in certain local registries or in the general register office in Edinburgh. If seisins are not recorded, they shall make no faith in judgment to the prejudice of those who have acquired right to the lands contained in them; but the non-registration does not avoid the seisin.

Registration.

It will readily be seen how anxiously the Scotch law provides for the publicity of the rights and the transfer of the rights to property. The advantages of a system so wholly foreign to the policy of modern English law have not been deficient in advocates. Blackstone, after describing the forms of English conveyancing, observes: "In these there is certainly one palpable defect, the want of sufficient notoriety; so that purchasers or creditors

kept on his clothes, kept the table, came from his chamber to the hall, whistled to himself and danced." In this case, "no particular disease, but only sickness, was proved." In going to kirk or market, the grantor must not be supported; but when he goes not for the express purpose of validating his deed, "but principally to hear sermon or for devotion, or about affairs to the market," then, "taking the party by one hand, or helping him at a rugged ground, would not infer supportation;" and "if a gentlewoman accustomed to be led by the hand, should go so led to kirk or market, by reiterated acts it might be sufficient for inferring health or convalescence;" but it may afford a presumption of continuance of sickness, and "therefore in that case ladies behaved to forbear being led from honour" (Stair, III. 4, 28; IV. 20, 46). The law has since been altered as above stated.

Law. cannot know with any absolute certainty what the estate and title to it really are, upon which they are to lay out or to lend their money. In the ancient feudal method of conveyance (by giving corporeal seisin of the lands) this notoriety was in some measure answered; but all the advantages resulting from them are now totally defeated by the introduction of death-bed devises and secret conveyances" (2 Comm. 342).*

Sect. 4.—Rights in respect of Moveable Property.

Moveables. 290. The transfer of and title to moveables will not detain us long. Perhaps the most striking distinction between this branch of the Scotch law and the English law of personal property, is the fact that the former permits such a limitation of moveable property as amounts, in short, to an entail. The heirs to whom it is limited acquire a *jus crediti*, and in that right can prevent alienation, and cast in damages the heir contravening the prohibition against it.

acquired by marriage. (1.) Moveables may be acquired by *marriage*, which is, in truth, a legal assignation, by the wife to the husband, of her whole moveable estate; but the husband cannot, by any testamentary provision, donation *mortis causâ*, or gratuitous deed on death-bed, prejudice either the *jus relictæ*, or widow's part, or the *bairns'* part. The former, where there are *bairns*, is a third; and where there are none, half. The *bairns'* part, if the widow live, is a third; if she be dead, a half. Property may be excluded from the *jus mariti* by the direction of the person conveying; and the *jus* never extends to paraphernalia, which include the lady's clothes and proper ornaments—the whole *vestitus* and *mundus muliebris*. This right of the husband is nullified by the dissolution of the marriage, by death within a year and a day of its contraction, unless there have been a child of the marriage born alive.

Legitime. (2.) Succession by *legitime* and *jus relictæ*.—Children are entitled, as already observed, after their father's death, to a share of his moveable property, which is called their *legitime*, or portion natural, or *bairns'* part of gear. This is a right belonging only to *children*, and affecting only the *father's* estate. The *jus relictæ* has been already explained.

(3.) Succession *ab intestato*.—If the intestate die unmarried, then his whole moveable property, and if married, then the deceased's part (that is so much of his moveables as the *widow* and *bairns*, either or both, are not entitled to), descends equally to the nearest of

* The propriety of establishing a general registry of deeds in England has been a subject frequently mooted in Parliament. The difficulty of devising adequate machinery appears to offer a serious impediment to the accomplishment of the design; and the experience of the local registries of Yorkshire and Middlesex, and the Bedford Level (15 Car. II. cap. 7; 2 & 3 Anne, cap. 4; 6 Anne, cap. 35; 7 Anne, cap. 20; 8 Geo. II. cap. 6), is fruitful of warnings against hasty legislation on the subject. In 1652 a commission of twenty-one members, appointed in the preceding year by the House of Commons, to "inquire of the inconveniences of the law," prepared a bill for a general register, upon a plan recommended by Sir Matthew Hale (see his tract, entitled, *A Treatise, showing how useful, safe, reasonable, and beneficial the enrolling and registering of all Conveyances of Lands may be to Inhabitants of this Kingdom*; Lord Somers' Tracts, by Sir W. Scott; vol. vi. p. 191). A similar bill was brought in, in 1657, 1663, 1664, 1670, 1677, 1685, 1693, 1694, 1697 and the two following years, in 1734, 1758, and in 1816. Roger North tells us that his brother, the Lord Keeper, highly approved of the plan (*Life*, vol. i. p. 224), as did Sheppard, the ostensible, though not real author (see Buller J., 4 D. & E. 649) of the celebrated *Touchstone* (England's Balme, p. 115).

kin, the whole blood excluding the half, and the lines of succession following in the same order as in heritable succession. If the heir of the intestate, in his heritable estate, comes in with the other next of kin, and will not share the heritable estate with them, he will have no part of the moveable.

(4.) Succession by *testament*.—Testamentary dispositions of the dead's part are valid by the law of Scotland, although executed on death-bed, provided they be in writing (or authenticated by a notary or a clergyman and two witnesses), if they express, in whatever form, the testator's disposing intentions.

(5.) *Assignations* are conveyances, whereby one who is in the right of any subject may convey the property of it to another, who is thereupon entitled to perfect his right by legal proceedings. *Intimation*, as the formal document is called, or some notification equivalent, given to the debtor, is essential to the completion of the conveyance; for although an assignation not intimated is good as against the grantor, yet a second assignation intimated will be preferred to the first assignation not intimated. Payment of interest by a debtor to a creditor is equivalent to intimation.

(6.) *Cessio bonorum*.—An insolvent debtor having been imprisoned for one month, whose failure has not been fraudulent, who has disclosed all the circumstances of his bankruptcy, calls together his creditors, and the Court of Session will grant him a *cessio*, by which he is liberated on making a conveyance *omnium bonorum* (with certain necessary exceptions) for the benefit of all his creditors, according to their respective interests. This *cessio* does not apply to property subsequently acquired by the debtor: that is, notwithstanding, attachable by creditors.*

Sect. 5.—The Court of Session.

291. Without venturing to describe the system of local tribunals or the system in which criminal law is administered in Scotland, we shall confine ourselves to a brief statement of the functions and character of the Court of Session, the supreme tribunal *in civilibus*, and whose constitution, from the importance of its functions, is naturally a subject of curiosity.

* To prevent the anticipated evil effects of a system, which, by liberating the debtor, should enable him again to abuse the credulity or deceive the caution of mankind, "the law hath also appointed that magistrates, where dyvours are incarcerated, must not set them out until they have the habit appointed to be worn by dyvours as their outmost garment; and they ought to set the dyvour for some time, in the most public time of the day, upon a place appointed for that purpose, commonly called the dyvour-stone. And these decreets bear, that the dyvour shall be no longer free from personal execution than while that habit is upon him, when his clothes are on, and so visible that all who converse with him may see it" (Stair, IV. 52, 34). But the improved humanity of modern times dispensed with the dyvour's habit; it would, as Lord Meadowbank observes, "according to the present state of the public feeling, be a disgrace to the public administration of justice. It would shock the innocent, it would render the guilty miserably profligate" (Smith v. Likely, 6 Feb. 1813). The case of Rutherford, 5 Dec. 1676 (*Dirl. Dec.* 193), appears to have been one of the first in which the habit was dispensed with; and although the party appeared to have contracted the debt as cautioner for his father, several of the lords hesitated, being "of opinion that the act of *sederunt* made no distinction, and being made upon good consideration, and conform to the practice of all other nations, that bankrupts might be known by a habit to be persons that deserved no trust, and that others may be affrighted from contracting or undergoing debts which they are not able to pay." It is abolished by the 6 & 7 Will. IV. cap. 56, s. 18.

Law.
5 Ann.
cap. 8.

The Articles of Union (5 Ann. cap. 8, art. xix.) provide that the Court of Session,* or College of Justice, should, after the Union, and notwithstanding thereof, remain, in all time coming, within Scotland, as it was then constituted by the laws of that kingdom, and with the same authority and privileges as before the Union; subject, nevertheless, to such regulations for the better administration of justice as should be made by the parliament of Great Britain; and that thereafter none should be named by her Majesty, or her royal successors, to be ordinary lords of session, but such as had been in the College of Justice as advocates or principal clerks of session for the space of five years, or as writers to the signet for the space of ten years; with this provision, that no writer to the signet should be capable of being admitted a lord of session, unless he had undergone a private and public trial in the civil law before the Faculty of Advocates, and be found by them qualified for the said office, two years before he had been named to be a lord of session; yet so as the qualification made or to be made for capacitating persons to be named ordinary lords of session should be altered by the parliament of Great Britain.

The privileges granted to the judges of this high tribunal by the kings of Scotland were very considerable, and evince a great solicitude to render the administration of justice pure and unsuspected.† No lord can sit and vote in any case where the pursuer or defender is his father or father-in-law, brother or brother-in-law, son or son-in-law, or uncle or nephew.

Actions: Lord Stair considers the actions known to Scottish law as divisible under four heads.

declaratory; (1.) *Declaratory* actions, wherein the right of the pursuer is craved to be declared, but nothing is claimed to be done by the defender. Any defence that he might have used in the declaratory action, the defender is precluded from using in the petitory or possessory actions.

* "This court was called the Session, because it was to sit at such places as the king appointed, but was not to follow his court, as his council did before, nor to go through the kingdom as the Justice-General and Chamberlain did. By that title it was also distinguished from ecclesiastic courts, which were called consistories, where the judges did stand in administering justice" (Stair, IV. 1, 8).

† Thus, by the statute 1537, cap. 68, entitled *The King's good Mind anent the Lords of Session*, the king promises, "that he shall not by any private writing charge, command, or desire the Lords to do anything otherwise, in any matter that shall come before them, but as justice requires, or to do any thing that may break statutes made by them; and that he shall authorise, maintain, and defend their persons, lands, and goods from all harm, wrong, and hurt and injury, to be done to them by any manner of person; and who does in the contrary shall be punished with all rigour. And because they present his person, and bear his authority, in doing of justice, that he shall have them in special honour and maintenance, and shall give no credit to any man that will murmur them or any of them, by doing wrong or dishonesty; but they shall be called before him, and gif they be found culpable, to be punished therefor, after the quality and fault of the demerit; and if they be found clean and innocent, the person complaining shall be punished with all rigour, and never have credit with him again. Likeas, he exeems them frae all paying of taxes, contributions, and other extraordinary charges to be uplifted in any time thereafter. And grants to them, that gif any person dishonours and lightlies them, or any of them, any manner of way, that they command and charge and put the person or persons in ward in any of his castles they will, till they have made satisfaction of the fault at the Lords' consideration, if the fault be small and injurious; and gif it be great, till the king be advertised, that he may cause the same to be amended, and punishment made thereof as effeirs."

(2.) *Petitory* actions, so called because something is claimed to be done or suffered by the defenders, seek to establish a perfect right in the pursuer, whether it be real or personal, such as the restitution or delivery of moveables, and all poindings of the ground.

(3.) *Possessory* actions, or judgments, are such as claim the transfer, retention, or recovery of possession, and do not insist upon an absolute right. Of this kind are actions of spulzie, which are sustainable if the pursuer has a title only in possession. Spulzie is the unlawful taking away of moveables without consent of the owner, and the action seeks restitution with all possible profits,* or reparation. Wrongous intromission with moveables is another example. In neither of these cases is other than a lawful possession necessary as the foundation of the action.

Actions may also be subject to another division, familiar to European jurisprudence: they may be considered as either *real* or *personal*.

(1.) A *real action*, *actio in rem*, is founded on a right in the thing itself—*jus in re*, founded either on the right of property, *jus dominii*—or in the rights of servitude, hypothec, pledge (*jura servitutis, hypothecae, pignoris*), &c.

(2.) A *personal action* arises from a right of obligation against a person, or a *jus ad rem*. In the first case it can be directed only against the obligee or his heirs; in the second, against whomever possesses the subject in which the right exists, although they may not represent the obligee.

There appears to be another and technical division of actions, into ordinary and extraordinary; which, being founded on forms of process, we shall not further consider.

It will be well to describe briefly the various stages of an ordinary action; in which Mr. Swinton's clear and accurate sketch will be a useful and safe guide (see Spence's *Inquiry*, App. No. II. p. 569).

An ordinary action is instituted by an original writ called a *summons*, prepared and signed by a writer to the signet, and passed her Majesty's signet. The summons is of three parts:—

(1.) The *libel*, setting out the ground or circumstances on which the pursuer lays his action, *e. g.* for payment of an alleged debt.

(2.) The *decerniture*, or *conclusion*, stating the terms on which the pursuer desires a decree or judgment to be pronounced in his favour.

(3.) The *citation*, or *will*, is a warrant summoning the defender to appear before the court on a certain day, or to allege a reasonable cause to the contrary. The defender is served with a copy of the summons, enters an appearance, and having seen the summons and writs founded on, puts in written *defences*, containing simply a statement of the facts and pleas of law, and the documents evidencing them, upon which his defence rests. The pursuer is allowed to see the defences and documents, and then is the action debated.

The hearing takes place, in the first instance, before the *Lord Ordinary*, sitting in the *Outer House*, as it is called, who may pronounce either a definitive or interlocutory judgment, according to the nature of the case; or, if the case involve a question of difficulty, he may

* It has been held, however, that a tailor could not seek damages for the loss of his trade through the illegal taking away of his thimble and shears. The damage must be direct, and not consequential.

Law. appoint the parties to put in argumentative pleadings in writing, called *memorials*.

Condescend- If the parties differ as to the truth of facts, and a proof by parole testimony becomes necessary, two courses are open to the Lord Ordinary; he may judge of the relevancy of the libel, and allow a proof, after advising special pleadings to be put in for that purpose, which are called a *condescendence* and *answers*. In the one, the pursuer sets out backed by the facts he avers and offers to prove in support of his libel; in the other, the defender admits or denies the pursuer's averment, and makes counter-averments, if he has any. On the other hand, without determining the relevancy of the libel in *illo statu*, the Lord Ordinary may allow a proof before answer.

Proof. The *proof* is taken in the presence of a commissioner appointed by the Lord Ordinary, who examines the witnesses, commits their depositions to writing, and reports the whole, either to the Lord Ordinary or to the court, according to his directions.*

Representation. Whatever judgment the Lord Ordinary pronounces, the losing party may submit it to his review within a certain period, by an argumentative pleading in writing, called a *representation*. This representation the Lord Ordinary may appoint to be answered, the *answers* being also argumentative pleadings on the other side, sustaining the judgment. Upon this contest the Lord Ordinary pronounces an interlocutor, adhering to or contradicting his former judgment. If he adheres, a second representation is competent; and if it be appointed to be, and be answered, and the judge still

adheres to his decision, no further proceedings in respect thereof can take place in the Outer House. Law. If the Lord Ordinary should alter his opinion, two representations are also available.

The cause thus disposed of, may be brought under Reclaiming the notice of one of the two divisions of the Inner House petitions. by presenting a *reclaiming petition*, which is printed, and distributed among the judges, by whom it is either appointed to be answered or *simpliciter* refused. When the answers are put in, the case is enrolled for advice. The petition and answers having been considered by the judges at home, are decided upon in open court; and the decision can be again submitted to them by a second reclaiming petition; and if, on advising on this, their lordships adhere to their first judgment, the cause is final in this court. It is to be understood that the two judgments, either of the Lord Ordinary or of the Division, must be in favour of the same party, and in the same terms; for should any alteration be made in the judgment either of the Lord Ordinary or of the Division, it is competent for the losing party twice to represent or reclaim.

The Court of Session has an original and privative Jurisdiction in all actions of declarator for ascertaining rights, and in all actions of reduction for setting aside false or improbative writings. It has also the exclusive Court of Session. jurisdiction in processes of *cessio bonorum* and many other cases. It has large powers as a court of review, and, in addition to its ordinary jurisdiction, appears to have exercised a species of prætorian authority, called its *nobile officium*.

Lord Stair observes, that "new cases require new *Nobile cures*," and that the strict rules of law should often *officium*. be relieved by the equitable interposition of the judge. He adds, that "every sovereign court must have this power, unless there be a distinct court for equity from that for law, as in England." The Privy Council of Scotland formerly administered equity; and it appears to be thought that the Court of Session has succeeded to its powers in this respect. A few instances of the exercise of this power, as claimed, illustrate the subject. The Court of Session annexed a penalty for not observing certain regulations prescribed by a statute, asserting that it had the right thus to make additions to the statute, to render it effectual; but this decision was reversed by the House of Lords on appeal. It has appointed judges to fill a temporary vacancy; it has appointed trustees, those named having died or declined to act; it appoints factors, or guardians, to take charge of the affairs of those who by nonage, incapacity, absence, or other cause, might suffer loss, if their affairs were neglected.

From the decisions of the Court of Session an appeal lies to the House of Lords.

It cannot escape the most cursory reader, that in this hasty review of the law of Scotland, the criminal and ecclesiastical law, and correlative matters, have not been alluded to. This omission has arisen from a desire to consider more fully than would otherwise be practicable those doctrines of Scottish law which afford the greatest interest to the English reader.*

* For the materials of this chapter the writer is indebted chiefly to Lord Stair's *Institutions*, edited by Mr. More (1832), and Mr. Burge's *Commentaries on Colonial and Foreign Law*.

* Mr. More, in his learned notes to Lord Stair, has discussed some very interesting points relating to the Scottish law of evidence. The subject is one of such obvious value and general interest, that I must be permitted to state the substance of his remarks. In his opinion, the law of Scotland, as it existed no very long time back, treated all witnesses as incompetent, to whose evidence full and entire credit might not be given. The first consequence of this doctrine, and that not the least remarkable, was, that, as to such witnesses as the law recognised, full credence was to be given, the judge being relieved of the onerous duty he had in every court in Europe to perform, the duty of weighing well, and setting the true value upon, the testimony offered before him. The law itself had determined who was, and who was not, trustworthy; and more attention appeared to be paid to the number of witnesses than to the quality of their evidence. It excluded domestic servants, tenants, paupers, and all others who were supposed to be more or less subject to influence. It even excluded women. This rule, slightly relaxed, subsisted up to a late period; for in 1675 the Court of Session determined that women could not be adduced to prove certain facts respecting the loan of a bed; it being pleaded, "that albeit women be admitted witnesses at the bearing of a child, where men cannot be present, they were never admitted in any other civil process." "The lords found the reply of lending the bed relevant to be proved by habile witnesses, but refused to admit women witnesses." The rule became more and more relaxed, until women were held admissible as witnesses *ubi est penuria testium*. In 1736, women were not admitted to prove a grantor crazy, because there was no penury of witnesses. The rule is now considered as abolished; but the custom is, that men, and never women, should attest deeds.

Further, the rule of Scotch law which excluded so large a class of persons, must also have often prevented the only evidence capable of reflecting light on many transactions. The old rule still subsists to a certain extent. The father or son of a party, his uncle and nephew, his mother, brother and sister, and all other relations, uterine and consanguinean, and even his mother-in-law, stepmother, son-in-law, and brothers-in-law, are held to be generally incompetent witnesses for him. The whole of Mr. More's note is highly interesting and suggestive (Stair, vol. ii. p. 409).

L A W.

CHAPTER VII.

THE LAWS OF THE BRITISH COLONIES AND DEPENDENCIES.

Law. 292. THE Privy Council, previous to 1722, came to the following resolutions:—

Settled colonies. (1.) That if there be a new and uninhabited country found out by English subjects, as the law is the birthright of every subject, so, wheresoever they go, they carry their laws with them; and therefore such new found country is governed by the law of England; though after such country is inhabited by the English, acts of parliament made in England without naming the foreign plantations, will not bind them.

Conquered colonies, (2.) Where the king of England conquers a country, there the conqueror gains a right of property in such people, in consequence of which he may impose on them what laws he pleases. But,

and their laws. (3.) Until such laws are given by the conquering prince, the laws and customs of the conquered country shall hold place, unless where these are anything contrary to our religion, or enact anything that is *malum in se*, or are silent, for in such cases the laws of the conquering country shall prevail (2 P. W. 75).

The British possessions may be considered as acquired, (1) by settlement, and (2) by conquest; while there are others—the Channel Islands and the Isle of Man—the sovereignty of which has been otherwise obtained.

British colonies; settled, (1.) The colonies *settled* by English subjects are—New Brunswick, Nova Scotia, Cape Breton, Prince Edward's Island (about 1497), Barbadoes (1605), the Bermudas (1609), St. Christopher's (1623), Nevis, (1628), the Bahamas (1629), Gambia (1631), Montserrat and Antigua (1632), Jamaica (1655), Tortola and Anguilla (1666), New South Wales and Sierra Leone (1787), Van Diemen's Land (1803), and New Zealand (1839).

and conquered. (2.) The colonies acquired by *conquest*, or rather by capitulation, cession, or treaty, are—Dominica, Grenada, St. Vincent, Tobago, and Upper Canada (the possession of which was assured to this country by the treaty of 1763), Jamaica, the Falkland Islands, and we may add Gibraltar, though not properly a colony. The bounty of the crown, or the enactment of local legislatures, has conferred on these possessions the right to be governed by the law of England, as far as is suited to their condition. The remainder of our foreign possessions obtained by conquest are—Demerara, Essequibo, and Berbice, now united under one government, that of (1) British Guiana, (2) Cape of Good Hope, (3) Ceylon, (4) Lower Canada, (5) St. Lucia, (6) Mauritius, (7) Trinidad, (8) Malta, and (9) the vast possessions governed by the East India Company in Hindostan. The enjoyment of the respective laws of the dependencies has been assured to them.

Law. In those colonies in which the English law is said to operate, it operates so far only as it is suitable to the condition and circumstances of the inhabitants. It is, in short, rather the basis of their jurisprudence, inas- Operation of English law in the colonies. much as, in many cases, its provisions are modified, and its policy widely departed from by the enactments of the local legislatures and orders in council.

We must content ourselves, in this place, with pointing out the systems of law and their sources, which, Systems of colonial law. subject to the alterations introduced by local legislation, operate in the colonies whose native jurisprudence has not been obliterated by conquest.

(1.) In the Channel Islands there is the *coutume* of Normandy; (2) in the Isle of Man, a law peculiar to that island; (3) in Malta, the Roman or civil law; (4) in Lower Canada and St. Lucia, the *coutume* of Paris; (5) in British Guiana, the Cape of Good Hope, and Ceylon, the Roman Dutch law, *Rooms Hollands-regt*; (6) in Trinidad, the law of Spain; (7) in the Mauritius, the *Code Civil*, promulgated by a decree dated the 15 *Vendemiaire*, an 14, and the Code of Civil Procedure, adopted in July, 1808; (8) in British India, the Hindoo and Mahomedan laws.

What reflections are not suggested by this bare enumeration of distinct and dissimilar systems of law, governing states in habits and location so far removed from each other, and all owing their present existence to that respect for the natural rights of the conquered which has ever with us moderated the ardour of conquest! When we also remember that the authority of these laws is permitted to extend not only to the conquered people, but to the conquerors; that they are not *personal** laws, compulsory only on those whose allegiance to them was native and original, but that they define the rights and regulate the conduct of our natural-born subjects, we cannot fail to be struck by the contrast our colonial policy offers to that of the great colonizing people of antiquity, who, while they permitted the subjugated race to enjoy their own institutions, never degraded the dignity of a Roman citizen by compelling his obedience to a foreign jurisprudence.

* When the Goths, Burgundians, Franks and Lombards founded kingdoms in the countries formerly subject to Rome, they left to the Romans the enjoyment of their own laws; the conquering people preserving theirs. Thus, in the same city, the Lombard lived under the Lombardic, and the Roman under the Roman law, and this gave rise to that condition of civil rights denominated *personal rights* or *personal laws*, in opposition to territorial laws. "It often happens," observes Bishop Agobardus, in an epistle to Louis le Debonnaire, "that five men, each subject to a different law, may be found walking or sitting together." Savigny, *Geschichte des Römischen Rechts im Mittelalter*, b. 1. k. iii. s. 90-1.

Law. *In jure Romano non est mirum nihil hæc de re extare, cum populi Romani per omnes orbis partes diffusum et æquabili jure gubernatorum imperium conflictui diversarum legum non æque potuerit esse subjectum* (2 Huber, lib. i. tit. 3, p. 538). The policy of England has been very different, and we see its fruits in the increasing importance of our colonial possessions, and their undiminished affection to the parent state.

Another reflection this enumeration of the sources English colonial law naturally suggests to the mind, is the wide-spread influence of Roman legislation, surviving the subversion of Roman greatness, and extending to countries of which Rome knew not the very existence. "*Servatur ubique jus*," epigrammatically enough, says a great jurist, "*non ratione imperii, sed rationis imperio*."*

Coutumes of Normandy and Paris. The *coutumes* of Normandy and Paris, the basis of the law operating in the Channel Islands, in Lower Canada, and St. Lucia, are in writing, and published, like the rest of the customary law of old France—a work commanded by Charles VII., after he had expelled the English, and which languished until the reign of Louis XII., and was not finally completed until 1620. The *coutume* of Normandy is best known by the edition and commentary of Basnage. Of the *coutume* of Paris, made the law of the French West India colonies by the 33rd article of the *Arrêt* of the *Conseil d'Etat du Roi* of May, 1664, a brilliant but superficial writer has said, that it is interpreted by twenty-four commentaries, agreeing in nothing but the proof of how ill the law was devised.† In Lower Canada some of the ordinances of the French kings also have effect.

Roman Dutch law. The Roman Dutch law consists of the civil law and the ordinances and edicts issued by the supreme power in Holland.

Spanish law. The Spanish law consists of—(1) the *Fuero Real*, the work of Alonzo the Wise, in 1255, but designed by his father, Ferdinand III., and intended as a precursor to (2) the *Partidas*, according to a writer quoted by Mr. Burge, "a complete body of law (*el cuerpo completo*), which combines the public with the private law, all digested and precompared in a most scientific, just, solid, Christian, and equitable manner, and which has not, perhaps, its equal in all Europe;" (3) the *Recopi-*

lacion, the first part of which was published in 1567, by order of Philip II., and which includes *Las Leyes de Estilo*, promulgated in 1310, as altered by the *Pragmaticas*, the *Ordeniamento Real*, authorized and published by Ferdinand and Isabella in 1496, the *Ordeniamento del Alcala*, made and authorized in 1348, the law of the Cortes of Toro in 1505, and other laws, and the *Autos Accordatos*, published in 1745; and as to the colonies, (4) the *Cedulas Reales*, or instructions to the governors of Spanish colonies; and (5) the *Recopilacion de las Indias*, a collection of the laws of the Spanish settlements.

Such, with the *Code Civil*, are the chief sources of English colonial law: and we have now to allude briefly to the sources of the laws of British India.

In allusion to a king who has effected a recent conquest, "let him," says Menu, the great Hindoo legislator, "establish the laws of the conquered nation as declared in their books" (ch. vii. 203). A British act of parliament has declared, in reference to the dominions of the East India Company, that "it is expedient that the inhabitants should be maintained and protected in the enjoyment of their ancient laws, usages, rights, and privileges" (21 Geo. III. cap. 70). To a great extent the wish of the legislature has been complied with; and while criminal justice is administered according to a code promulgated by British authority, and while all that relates to the conduct of suits, the admissibility of evidence, and the competency of witnesses is defined by British law, still in all matters relating to the two great heads of inheritance and contract, the king's courts in India are to accord to the natives the benefit of their own law.* Thus, in these respects, the Hindoo is governed by his own law, the Mahomedan by that to which he had anciently owed allegiance; but the Parsee (Persian emigrants, settled for above a thousand years in Bombay), having properly no law of his own, is governed in a great measure by that of England. The Hindoos exceeding by far in numbers either of the other races, it will be Hindoo law alone which will be here considered.

The Hindoo claims for his law a divine origin. The their books to which he ascribes this character contain either sources; that revelation which he calls *sruti* (*audition*), or revealed law, and which he believes to have been wholly

* The grounds of the authority of the civil law in Holland, as recited by Groenewegen, illustrates the source of its influence in modern Europe. *In Belgio autem multo majorem auctoritatem obtinet jus Romanum: cum enim passim summâ ratione atque æquitate abundet, olim pro justitiæ et æquitatis exemplo in judiciis allegatum, tandem vero etiam pro legibus receptum est atque etiam num regulariter legum vim atque auctoritatem apud nos obtinet* (Ad. Inst. lib. i. Proem. n. 3). So says Dumoulin in reference to France. *A jure scripto Romano mutuamur quod et æquitati consonum et negotio de quo agitur, aptum congruumque invenitur, quod non unquam fuerimus subditi Justiniano magno aut successoribus ejus sed quia jus illo auctore à sapientissimis viris ordinatum, tam æquam est tam rationabile et unde quaque absolutum ut omnium ferè Christianarum gentium usu et approbatione commune sit effectum* (Gloss. n. 150).

† Voltaire, *Dict. Phil.*, art. *Lois*. Mr. Park gives a list of thirty-seven commentaries and gloss on the *coutume* of Paris, and twenty-seven on that of Normandy (*Contre Projêt to the Humph. Code*, pp. 249-52). *Il n'étoit possible en France*, says a learned English jurist, *même aux jurisconsultes les plus profonds d'apprendre à connoître cette multitude d'usages alors en vigueur dans nos provinces*. And he adds, in a note, *c'est par rapport aux nombreuses coutumes, si souvent opposées, qui étoient alors en vigueur dans l'ancienne France, que Montaigne a dit, qu'il y avoit en France plus de lois que dans tout le reste du monde ensemble, et plus qu'il n'en faudroit pour régler tous les mondes d'Epicurus* (*Lettres sur la Cour de la Chancellerie*, p. 297). Of old France, Napoleon said, that it was *plutôt une réunion de vingt royaumes, qu'un état*.

* To have described the judicial system of India, would have required more space than we can afford. It may be mentioned, that in the north-west provinces of Bengal, which now constitute the Agra government, civil suits, to which Europeans are not parties, and where the amount in litigation does not exceed 30*l.*, are decided by a native judge, or *moonsif*. If the *res litis* is under 100*l.*, the suit is decided in the *Sudder Ameen*; and above this is the principal *Sudder Ameen*, unlimited in its jurisdiction, as far as the amount of the subject litigated is concerned, and is a court of appeal from the other courts. Above these are the district judges (Europeans), who preside over the *Zillah* courts, from which an appeal lies to the appellate court, the *Sudder Dewannee Adawlut*, who also receive appeals from the principal *Sudder Ameens*. The average duration of a suit in these provinces is four months and ten days. The proportion of suits to population, in Bengal, is about one suit annually to 381 persons (*Paper* by Colonel Sykes, Stat. Soc. London, 20th March, 1843). In 1793, the *Zillah* courts were established in Bengal, as also the court of *Sudder Dewannee Adawlut*, and the provincial courts of appeal of Calcutta, Patna, Dacca, and Moorshedabad. It may, perhaps, be proper to observe, that in doubtful matters the European courts take the opinion of Pundits or Hindoo jurists. Sir William Jones, declared, however, "that he could not with an easy conscience concur in a decision merely on the written opinion of native lawyers, in any case in which they could have the remotest interest in misleading the court."

Law. dictated by divinity, or *smriti* (recollection), or remembered law, preserved by inspired writers, who had revelation present to their memory, and who have recorded holy precepts for which a divine sanction is presumed. Forensic law, as distinguished from religious doctrine and ritual law, is contained chiefly in the *Smriti* or *Dharma Sastra*. This is embodied in the writings of ancient authors, such as Menu, with whom, in most points, most of them concur; but the number of authors entitled to this rank in Hindoo jurisprudence is a matter of doubt.

their species; Law has been cultivated as a science by this singular people, and we find among them divers law-schools, each of which acknowledge the authority of different commentators upon their ancient books. Indeed, the authority of these commentators appears, in courts of law, to have superseded in a great measure the authority of the writers they profess to interpret; and as these commentators differ among themselves, and our law-courts in a great measure follow the commentator approved by the school prevailing in the district in which they exist, it is obvious that there is properly no one system, but in truth many systems, of Hindoo law, operating simultaneously in various parts of the country.

and schools of interpretation. The written law, whether *sruti* or *smriti*, is subject to the same rules of interpretation. Those rules are collected in the *Mimansa*, which is a disquisition on proof and authority of precepts. It is considered as a branch of philosophy, and is properly the logic of the law. In the eastern part of India, *i. e.* Bengal and Bahar, where the *Mimansa* is less studied than in the south, the dialectic philosophy, or *Nyaya*, is more consulted, and is there relied on for rules of reasoning and interpretation upon questions of law as well as upon metaphysical topics. Thence result two schools or sects, which, by a various construction of the same text, deduce different inferences; and each of these schools is again divided into other schools, each adopting for its chief guide a particular author, to whose doctrines they give currency in particular districts. The works of these authors are *Digests* or *Commentaries*; and it appears to have been the policy of each successive dynasty in India to have issued some work of these descriptions, containing the rules by which they proposed to carry on the government.

Colonial judicial system. 293. Without referring to the complex judicial system of British India, it may be remarked, that justice is administered in our colonies by various courts of justice, empowered by royal charter or acts of the colonial legislatures. In Demerara, Berbice, the Cape of Good Hope, Ceylon, Trinidad, St. Lucia, Lower Canada, Newfoundland, the Mauritius, New South Wales, Van Diemen's Land, Western and Southern Australia, Jersey, and Guernsey, the supreme courts are courts of equitable as well as legal jurisdiction. They grant probate of wills and letters of administration, and have the custody of lunatics and the appointment of the guardians of minors. In the other colonies the equitable jurisdiction is administered by the governor, who,

Law. as ordinary, grants probate and administration. In Upper Canada is a Court of Probate, where the governor presides; and the civil list of Canada, settled by the 3 & 4 Vict. cap. 35, contemplates the appointment of a vice-chancellor—an office lately created in Jamaica. In most of the colonies there are courts of appeal (which probably in the West Indies will merge in those contemplated by the 6 & 7 Will. IV. cap. 17), the Judicial Committee of the Privy Council, established by the 3 & 4 Will. IV. cap. 41, being the ultimate appellate jurisdiction, when the *res litis* is of a certain amount. It receives appeals, also, from the *Sudder Dewannee Adawlut* courts, or supreme native courts of British India.

294. Legislative authority in the colonies is exercised, Colonial legislation. in some, by the king in council, and the laws are issued in the shape of orders in council; in others, and in the major number, by a body consisting of persons nominated by the crown, and of representatives chosen by qualified persons, each class (except in the case of the legislature of Newfoundland; 5 & 6 Vict. cap. 120) sitting apart. That the measures they pass should become law, they must first receive the assent of the governor. They may, however, be afterwards disallowed by the king. All laws, bye-laws, usages, and customs which shall be in practice in any of the plantations, being repugnant to any law made or to be made in this kingdom relative to the said plantations, shall be utterly void and of none effect (7 & 8 Will. III. cap. 22). The governors of colonies also, by their instructions, are forbidden to assent to certain laws which are supposed to be inconsistent with our public policy. Thus they are forbidden to assent to any act of their legislatures for the dissolution of a marriage. It is not to be understood that the establishment of a colonial legislature limits or affects in any way the rights of the Imperial Parliament to legislate for the colonies—a right asserted as far back as the time of the Protectorate (Scobell, *Ordin.* part ii. p. 132). But except on an exigency, it rarely exercises its extreme rights, leaving to the colonial legislature the duty of framing the laws suitable to the condition of its constituents.

It may be remarked in conclusion, that in British India the right of legislation is vested generally in the Governor-General, provided that in its exercise he does nothing to affect the mutiny acts, the prerogative of the crown, the authority of parliament, the rights of the East India Company, or any part of the unwritten laws or constitution of the United Kingdom, whereon may depend the allegiance of any person to the crown of the United Kingdom, or the sovereignty or dominion of the crown over any part of India. The Directors of the East India Company may disallow the laws made by the Governor in council; and it is to be remembered that the king's Commissioners for the Affairs of India control all acts of the Company concerning that country, and all official communications are to be approved by them; so that in fact, the crown, through its servants the Board of Control, has the right of disallowing all laws made in India (3 & 4 Will. IV. cap. 85).

OUTLINES OF THEOLOGY.

INTRODUCTION.

Theology. (1.) UNDER the general term *Theology* we comprehend all the knowledge which man can obtain respecting God, whether concerning His nature and attributes, or concerning the relation in which man stands to Him. This subject we shall divide into two portions, making the sources of our knowledge the basis of our distinction. These portions are *Natural Theology* and *Revealed or Scriptural Theology*. Under the first we propose to treat of that knowledge of God which the contemplation of His works and His providential care, as seen in the natural world, is calculated to instil into the mind of man. Under the latter we propose to ascertain what revelation God has been pleased to make of Himself to mankind, and what the Holy Scriptures teach us concerning the nature and attributes of the Deity, and the relation in which man stands to Him.

The science of Theology is very differently divided by different authors, but without any very great difference as to the subjects of which they treat under this name. Thus a common division (justly blamed by Limborch, *Theologia Christiana*, p. 1; comp. also Buddei *Institutiones Theologiæ Dogmaticæ*, lib. i. ch. i. sec. 39,) used to be that into, 1, *Archetypal Theology*, or that knowledge which God himself has, concerning Himself and divine things; and, 2, *Ectypal*, or that knowledge which, being derived from the former, is communicated from God in three different ways: 1, by the *Hypostatical Union*, to Jesus Christ. 2, by *Vision*, as to the Angels. 3, by *Revelation*, as to men. Turretin calls the former *Infinite Theology*, the latter *Finite*, and together they form his subdivision of *True Theology*, the whole subject being divided in *True* and *False Theology*, the latter including both *heathen* and *heretical Theology*. In Thomas Aquinas the first sections of the first part of his *Summa Theologiæ* treat of the nature and objects of Theology (under the name of *Sacra Doctrina*), as, for example, whether it be a science, &c. (Comp. also P. a Joseph *Idea Theologiæ Speculativæ*.)

Again, Turretin (p. 16 of his *Institutiones Theologiæ Elencticæ*) affirms that God is the *object* of Theology, which is denied by Limborch, who considers that the *worship* of God is the proper *object* of Theology; but this difference arises rather from the different senses in which they have used the word *object*. Thomas Aquinas very beautifully says Theologia "*a Deo docetur, Deum docet, ad Deum ducit*." (Comp. Buddeus, *ubi supra*, sec. 40-46.)

Again Buddeus defines *Theology*, a "knowledge of divine things, necessary to be known by sinful man in order to his salvation, joined to a power of teaching and defending the same." He divides it into *Theoretical* and *Practical*; lib. i. sec. 42. (Comp. also his *Institutiones Theologiæ Moralis Prolegom. passim*.) Another common division in Germany is into *Theology*, *Anthropology*, *Christology*, and *Eschatology*, the latter word meaning the doctrines concerning the *last things*, i. e. the Judgment, &c.

Some writers use the words *Theology* and *Religion* in the same sense, others distinguish between them. See some very able remarks in Dr. Turton's *Natural Theology* (p. 1-33) on this point. Bishop Marsh (*Lectures*, part ii. sec. ii.) has some useful suggestions relative to a systematic course of Theology.

With these references to common works on Theology we dismiss the consideration of the division of the subject, as it does not appear of much practical use, and certainly does not admit of proper discussion within our limits. (Comp. Buddeus' *Theol. Dogm.* lib. i. sec. 38.)

(2.) The subject here proposed for our consideration being of the deepest importance to man, has been treated of at greater length than most other depart-

ments of human knowledge. The inquiries, whether there be another state of existence after the present, and if there be, on what terms happiness is attainable there; whether man be an object of care to the Creator of the universe, and if he be, by what means he may become acceptable to this great Being; whether God has revealed himself to man, and if he has, what is the substance of that communication; these are questions of overwhelming interest to a rational and accountable being, and we cannot wonder, therefore, if every circumstance relating to the evidences for Natural and Revealed Religion, and to the interpretation of Scripture, has been examined and discussed with a minuteness and to an extent unequalled in any other science. We cannot, therefore, within the brief limits to which we must confine ourselves, profess to give more than a mere outline of the great truths which this science discloses to us. But our sincere and earnest desire is, that this portion of our work may prove of *practical* utility, by bringing forward, as far as our limits allow, the chief results which a just estimate of evidence, and a true interpretation of Scripture, present to man, and by indicating, where it shall appear desirable, the best sources for pursuing solid inquiries, and forming a right judgment on many questions of surpassing interest and importance.

1. For a general *Bibliography* on this subject, we may refer to Bishop Wilkins' *Ecclesiastes*; Bray's *Bibliotheca Parochialis*; Wotton's *Thoughts on a proper Method of studying Divinity*, 1734 (and reprinted 1818); and to the very valuable and copious bibliographical volume of Horne's *Critical Introduction to the Study of the Scriptures*. Among foreign works on Theological Bibliography, we may specify Walch, *Bibliotheca Theologica*; and in more recent days, the very useful systematic catalogues of Ersch, *Literatur der Theologie* (by Böckel, 1822); Winer's *Handbuch der Theologischen Literatur*, 8vo. 2 vol. 1838; and Clarisse, *Encyclopædia Theologica Epitome*.

2. On referring to the Miscellaneous Department, in BAPTISM, BISHOPS, CANON, BIBLE, &c., and to the Historical Division, under the titles APOSTOLIC AGE, MINISTRY OF CHRIST, MIRACLES, ECCLES. HISTORY, *passim*; HERESIES of the 1st, 2nd, 3rd, and 4th Centuries, &c., the reader will see that much more space has already been devoted to many Theological questions than they can usually obtain in works of this general nature. A repetition of those statements would be neither just nor satisfactory. Many branches of inquiry, therefore, which usually belong to Treatises on Theology having been anticipated in this work, we shall pass over these with brevity, while we supply at greater length what has not yet been touched upon, and thus endeavour to consolidate our Theological articles into a systematic form.

(3.) Having, therefore, considered Natural Religion, and having adduced some evidence to show that the Bible is a Revelation from God, we shall endeavour to point out the main substance of that revelation, and briefly to show what Scripture teaches—

1. Concerning God;
2. Concerning man as an individual;
3. Concerning the Church;
4. Concerning the Judgment, and the final condition of man.

CHAPTER. I.—NATURAL THEOLOGY.

The Power, Wisdom, Goodness, and Justice of God, &c.—His Government.—Man's Duties.—His Failure in them, and consequent Need of a Revelation.

Theology. (1.) In a former portion of this work (see ATHEIST) we took occasion to show that all who adopt the Atheistic Hypothesis necessarily involve themselves in endless difficulties and contradictions. Among other improbabilities, the Atheist has to assume that the present state of things must have existed from eternity, and to regard all that takes place in the universe as the result of accident or of blind necessity. For if it be admitted that there ever was a period in which the universe did not exist, it is not easy to avoid the acknowledgment that there must have been a creation, and, as a necessary consequence, that there must be a Creator, who is independent of all matter, and possessed of such attributes or qualities as are adequate to produce all creation out of nothing. It is this Creator whom we call God. Assuming, therefore, the existence of God, the main object of THEOLOGY is to ascertain the attributes and perfections of this First Great Cause, from whatever sources information respecting Him can be derived; and then to develop, as far as may be, the relation in which the Creator stands to his works. We shall thus, in some degree, be brought acquainted with God; with His designs respecting His intelligent creatures; and with our consequent duties towards Him, ourselves, and our fellow-men.

Observation 1. We do not notice the speculations of the German metaphysicians respecting the arguments for the existence of the Deity, because their views are but little relevant to our subject, and, besides, belong more properly to the department of Metaphysics. In the prosecution of the object we have in view, we are as little concerned with the speculations of Kant, and others of the German school, as the writer of a practical treatise on mathematics would be with a metaphysical disquisition on the nature of mathematical demonstration. We content ourselves, therefore, with referring to Kant, *Kritik der reinen Vernunft*, div. iii. sec. 3-7, p. 611-658, edit. 1794; and for some remarks on Kant's views, to a former part of this volume (*Moral and Metaphys. Philosophy*, p. 665-667). See also the Essay, "Ueber Begriff und Möglichkeit der Philosophie," by Professor Schmidt of Rostock, especially sec. 121-124.

Obs. 2. In demonstrating the existence of the Deity, English writers have adopted two modes of argument, the one called *a priori*, the other the argument *a posteriori*.

The argument *a priori*, as it is improperly termed, (See Turton's *Nat. Theol.* p. 236-276, but especially p. 242-245,) is that used by Dr. Clarke. It is not an argument *a priori* to reason that there must be such a being as God, when we argue back from the simple fact that something now exists, to the conclusion that something must always have existed which cannot be a contingent being. This is not reasoning *a priori*, it is only prior to the examination of particular phenomena.

On this argument, see Waterland's Dissertation on the argument *a priori*, &c., and Gretton's Review of the argument *a priori*. Dr. Turton states that he has materials for a complete history of this argument. The publication of such a work would be a great benefit to Theological literature.

The argument *a posteriori* is that which is otherwise called the argument from design.

Against this reasoning it has been contended that the very word *design* implies a *designer*, and its use is therefore a *petitio principii*.

The sufficient answer to this objection is, that no one wishes to use the word *design* till he has proved the existence of that which is necessarily called by this name. He states phenomena, which must result, he contends, from design. Here is the strength of the proof, and its first step, which is to infer design.

The next step is almost a self-evident proposition; if there is a design, there must be a designer. We would here merely refer to the strong expression of Sir J. F. W. Herschell, (*Discourse of the Study of Nat. Philosophy*, p. 7,) that the inquiries of Natural Philosophy, considered in reference to the existence and principal attributes of the Deity, have rendered "doubt absurd, and Atheism ridiculous." The pretended proof of La Place, that the law of gravitation (the only law which would, as far as we know, hold our system together) is a necessary deduction from the properties of matter, has frequently been considered and answered. See Robison's *Mechanical Philosophy* and Whewell's *Bridgewater Treatise*.

The books which have been consulted for the compendium of Natural Theology given in this chapter, are chiefly these:—

Bishop Wilkins's *Principles of Natural Religion*. Dr. Samuel Parker's *Demonstration of the Divine Authority of the Law of Nature*. Cudworth's *Intellectual System*. R. Baxter's *Reasonableness of the Christian Religion*. Archbishop Tillotson's *Discourses upon the Attributes of God*. Bishop Cumberland's *Treatise on the Laws of Nature*. Wollaston's *Religion of Nature Delineated*. S. Clarke, *on the Being and Attributes of God*. Archbishop King's *Origin of Evil*. Bishop Conybeare's *Defence of Revealed Religion*. Bishop Butler's *Analogy*, &c. J. Bowen's *Series of Discourses on the Principles and Evidences of Natural Religion*. Tunstall's *Lectures on Natural and Revealed Religion*. Tucker's *Light of Nature Pursued*. Abernethy's *Discourses on the Being and Natural Perfections of God*. Leland's *Deistical Writers*. Leland's *Advantages and Necessity of Christian Revelations*. Knight, *On the Being of a God*. Brown's *Essay on the Existence of a Creator*. Knowles, *The Scripture Doctrine of the Existence and Attributes of God as manifested by the Works of Creation*. Paley's *Natural Theology*. The *Bridgewater Treatises*. J. Foster's *Discourses on the Principal Branches of Natural Religion*. Crombie's *Natural Theology*. M'Culloch's *Proofs and Illustrations of the Attributes of God*. Lord Brougham's *Discourses of Natural Theology*. Dr. Turton's *Natural Theology*, considered in reference to Lord Brougham's *Discourse on that subject*.

We may also mention Bentley's *Sermons*, Barrow's *Works*, Ray's *Wisdom of God*, &c., and Derham's *Physico-Theology and Astro-Theology*, as being useful works for these points; though the two latter are superseded by Paley and other similar works. Fabricius, in his *Delectus Argumentorum et Syllabus Scriptorum qui veritatem Religionis Christianæ, &c. asseruerunt* (Hamburg, 1725), gives a full account of ancient and foreign writers who have handled this argument.

(2.) Now when we come to examine from whence our knowledge of God may be derived, it is evident that sources of information may be either natural or supernatural; either that light which is reflected so strongly from the world around us and within us, or direct revelation from God himself. We thus arrive at that two-fold division of Theology which is popularly expressed by the terms NATURAL and REVEALED RELIGION; and our endeavour shall, therefore, be to discuss the subjects according to this order. Let it be premised, however, that in endeavouring to ascertain, apart from revelation, some of the attributes of the Deity, our aim will be rather to direct attention to what may be gathered respecting the Supreme Being from the works of creation than from metaphysical considerations or abstract reasonings upon the necessary perfections of an eternal self-existent Creator. We have decided upon this course, partly because, abstractedly considered, most of the divine attributes are, from the very nature of the case, placed beyond the possible range of man's inquiries; but chiefly because

Theology. the visible creation, which is open to the inspection of every man, bears such marks of the Godhead, that all who do not read there palpable traces of his eternal power and goodness, must be regarded as without excuse.* Thus, also, as we are better able to gaze upon the sun through some intervening medium than with the naked eye, so may we more readily discern somewhat of the Creator's attributes and perfections, as He has revealed himself by means of his works, than by contemplating him as He exists in his essential majesty and glory.†

The power
of God.

(3.) The most cursory and unlearned view of the creation, then, suggests abundant evidence of the Divine Power. There is no perfection of the Deity so often marked and attended to by mankind as this. Nations who entertain but faint and imperfect ideas of any other of the Divine attributes, have yet vivid apprehensions of a supreme invisible Power. This perfection of God is to be read most plainly in the storms and convulsions of nature; yet it may be traced also in the structure of man's body, and in the world around us, in all its extent, variety, and teeming animation; whilst the vault of heaven above, studded with light and glory, bears indisputable testimony to the same attribute of the Creator. Or if the works of creation be subjected to the scrutiny of science, the result only reveals more fully the Maker's power. There is seen, that though the earth be peopled by countless myriads of living creatures, yet all were formed with surpassing care; all made accurately to observe their generic and specific distinctions; all depending for their subsistence on Him who created them. Then the firmament above, which at first might seem to be but a vast assemblage of heavenly bodies, wonderful indeed in appearance, but grouped together in indiscriminate splendour, is found to be made up of orderly systems, each subject to its own laws, all combining in one harmonious whole; some occupying positions that man's skill can define; others stretching out into an infinity of space, from the exploring of which the mind shrinks in conscious feebleness. We thus become impressed with the conviction that the power of the Creator is beyond comparison greater than any which we feel ourselves to be capable of exerting, or observe any other agents with which we are acquainted to possess. For whilst man finds his ability to act, continually and effectually controlled, our knowledge of creation, limited though it be, gives us no reason for supposing that any thing is beyond the possibilities of the power of the Deity: every thing that falls under our observation being the work of His hands; all the materials of which the universe is framed having been called by Him out of their previous nothing into their present existence. So far, therefore, as any judgment at all can be formed of the power of the Creator from the contemplation of the universe, the wise of all ages have considered themselves warranted to conclude that *omnipotence* is an attribute of the Deity.

The wis-
dom of
God.

(4.) The belief in an Almighty Creator requires, also, that we regard Him as possessed of knowledge in every respect adequate to the work of creation. Whatever the extent of creation may be, known to Him who made all things must have been the whole system of the universe, in all the details of its arrangements, and

in the effects which can result from all possible combinations. There can, in fact, be no limits assigned to the intelligence of the Deity. It is upon this boundless knowledge, or *omniscience*, of the Supreme Being that the Divine *wisdom* is based, which is so conspicuously displayed in the visible creation. Let but a man, for instance, consider his own bodily and mental constitution, and he cannot fail to be struck with wonder at the thought that every one of his members is constructed in a manner best adapted to the discharge of the functions it is destined to perform; each part so arranged as best to receive the nutriment proper unto it, and to minister at the same time most effectually to the general purposes of human existence. Then, in mental endowments, how admirably adapted is man for his position in the creation! With powers of mind that qualify him for accomplishing the great results, by the mutual aid and co-operation of each with the other; with sympathies and affections, endowed with hopes and fears, and passions, without which mankind would not have been fitted for the various relations of social life, it is impossible for us, in all these adaptations, to overlook the wisdom of God! And if we turn our attention to the brute creation, we find the same wisdom displayed in those instincts and habits which tend to secure the irrational creatures from injury, and lead to the sustentation of life, and the continuance of their species. And how wonderfully has the material universe been formed, by climate, by seasons, and by all its treasures of natural productions, to minister to the well-being and enjoyment of every living creature on the face of the earth, whether man or beast! The deeper and more accurate our researches, the more boundless and sure do the evidence of the Creator's wisdom appear. Every thing is seen in its exact position; so that, in its individual order and operation, nothing interferes with the design and use of other things. Nothing is redundant, nothing defective, nothing disproportionate; but all is symmetry and perfection! The most complicated movements seem to minister only more effectually to the simplicity of others; counteractions are met by some antagonist influences; uniformity is diversified by infinite variety.* In a word, on whatever portion of the universe we look, there are presented to us such manifestations of order, arrangement, and design, for the accomplishment of certain well-recognised purposes, that the intellect of man fails to discover any other means by which the same results could be so effectually secured. The contemplation, therefore, of all this exquisite, superhuman contrivance, and matchless adjustment of every thing to its own end, cannot but lead to the conviction that, as the Lord is great, and great is His power, so His *wisdom* is *infinite*. (*Psalm cxlvi. 5, Prayer-book Translation*)

(5.) And whilst we thus infer the wisdom of the Deity from the manifest order of the universe, and from the adaptation of every thing to its individual purpose in the general system, we may not obscurely gather, from the uniformity of design and harmony of operation which pervade all nature, that the whole proceeded from One designing Power. So far as our researches are capable of extending, we perceive the same laws every where to obtain, the same effects following the same causes. Wherever, for example, we

* McCulloch, *On the Attributes*.

Theology. can discover motion, the laws of motion are every where the same. The day and night, summer and winter, seed-time and harvest every where alike succeed each other with the same unbroken regularity. Provision for the sustenance and propagation of organized and animated being is made, throughout the universe, with the same manifest regard to those analogies and proportions which are the natural characteristics of one harmonious design. It may be granted, indeed, that the unity of design and operation which we thus trace in the natural world does not conclusively prove the *unity of God*, yet it may be legitimately maintained, that so far as any illustration of the Divine attributes are to be collected from the universe of mind and matter, it is but natural to infer unity of agency from unity of design. Even Mr. Hume, therefore, acknowledges, that "were men led into the apprehension of invisible intelligent power by a contemplation of the works of nature, they could never possibly entertain any conception but of one single Being, who bestowed existence and order on this vast machine, and adjusted all its parts according to one regular plan or connected system."*

Omnipresence.

(6.) Then, again, as the universe is a work of the Creator's power, made up of systems countless in number, and related to beings infinite in multitude, there is no region to which our knowledge can extend, or of which our imagination can conjecture, that is not subject to the Creator's notice. For wherever creation exists, there is necessarily found the operation of such laws as are calculated to secure the results toward which each portion of creation is destined to contribute. "But a law cannot administer itself: all law, on the contrary, always supposes an agent; and without the presence of an agent that is conscious of the relations in which the law depends, and competent to produce the effects which the law prescribes, the law must be without efficacy. Hence we infer that the intelligence by which the law was at first ordained, and the power by which it is put in action, must be present at all times, and in all places where the effects of the law occur; that the agency of the Divine Being pervades every portion of the universe, producing all action and passion, all permanence and change."† In other words, every portion of organized or unorganized matter, of corporal or spiritual substance, is superintended by an *omnipresent* God with the same vigilance as if it were the sole object of the Divine attention.

The goodness of God.

(7.) But if God be thus a Being of infinite power, boundless in wisdom, and who is every where present, it becomes a matter of great importance to ascertain whether or not these Divine attributes are exerted to a benevolent end. And that *goodness* is an attribute characteristic of the Deity, may partly be inferred from the fact, that all the inanimate portions of the creation, which are themselves incapable of either pleasure or pain, are yet manifestly formed to minister to the happiness of sentient and intelligent beings. It has not less truly than eloquently been observed, that "every sun-beam that lightens man's brow, and cheers his spirit; every flower of the field that opens its blossom grateful to the smell, and delighting the eye; every shower that falls to refresh the earth; the genial atmosphere; the verdant meadow; the perennial water-spring; all ministering to the pleasure or neces-

sities of the animate creation, prove the benevolence of the great Creator."* Then, there is the "aptitude of every sentient being to the circumstances in which it is placed; the provision made for its support, its defence, and its enjoyments; the sources of gratification with which man and all other sentient beings are furnished:"† all these separately and collectively testify that God is good, for all things might have been differently ordered. The very extensiveness of the Divine bounty may render our perception of it less vivid; and the common benefits of our nature may escape our observation, because they are common: nevertheless, there is no age or nation on which the Deity has not left visible traces of His fatherly care and goodness towards the works of His hands. It need not be denied that innumerable evils present themselves to our notice, in those wars, and famines, and pestilences, and individual distresses that visit the world, in the crimes of mankind, and in the sufferings of the brute creation. But whilst imperfection is inherent in every thing that is not Divine, and moral evil, and therefore disorder, seems to be the possible attendant upon the permission of free agency in intelligent beings, it may safely be maintained that good is, by the appointment of God, made greatly to preponderate over evil; and that the very sufferings which are permitted to exist, only prove the more powerfully illustrative of the benevolence of the Almighty. As, moreover, the human mind is too limited in its range to be able fully to comprehend, or even trace out, the various connexions and dependencies of the universe, we are not in circumstances to decide with certainty upon the reasons and results of the Divine operations. Those things, therefore, in creation, or in the order of Divine Providence, which sometimes appear to us to be imperfect or evil, may really, though we discern not how, be working some beneficial result; nay, may be absolutely necessary for securing the completeness and happiness of all God's works.

(8.) To regard, however, the Deity as a Being of essential goodness, notwithstanding the existence and prevalence of evils, implies that we are impressed with the conviction, that of all God's creatures, each has assigned to it that exact measure of good and evil which leaves no room for suspicion that the Deity has acted with partiality towards any. In other words, we are accustomed to regard the Deity as a Being of unimpeachable equity. Indeed, when we see, in the general frame of nature, such importance assigned to individual operations, as that whilst every thing contributes to the harmony of the universe, that harmony can be maintained only as the influence of each thing by itself is preserved in its integrity; we trace in the wisdom that thus contrived all things, the equity, also, which provided that nothing in creation, however apparently insignificant, should be without its due advantage and honour in the system. Or, again, as it cannot but be admitted that the Creator stands in the same relation to all His works, He having, for his own good pleasure alone, alike created all, there is no apparent reason why the Deity should, from partiality, prefer one of his creatures to another. Independently, therefore, of that general perfection which is usually ascribed to God, and which excludes the idea of such defects as partiality would imply, it may be assumed that God is alike good to

* *Natural History of Religion*, sec. ii.

† *Ibid.* p. 181.

Theology. all the works of his hands. For although apparent inequalities are to be observed in the course of the world, yet the more accurately these are examined, the less they are found to be, and the fuller the evidence that there can be no "respect of persons," or of creatures, "with God."

(9.) Such being the chief attributes and perfections which considerate minds have almost universally assigned to the Deity, it cannot but be a subject of great interest to ascertain what the moral relationship is in which man stands to this God. Indeed, the contemplation of those things in creation which daily challenge our observation, seems almost unavoidably to force upon us an inquiry of this nature. If all that variety and skill which are written on the works of God lead to the conclusion that all and each of those works were made for purposes peculiar to each; and if we are confirmed in that conclusion by further observing the world, animate and inanimate, subject to those fixed laws which secure the fulfilment of certain known and beneficent purposes, can man form an exception to the rest of God's works, in having been created for no purpose whatever? And if man were made to sustain some part in the world, is it likely that his Maker should leave him destitute of those attributes of body and mind which should best serve to secure the end of his creation? Is it not, on the contrary, reasonable to suppose, that as an examination of the natural world sufficiently indicates the purposes for which irrational creatures were formed, so a careful survey of man's endowments in body and mind will afford intimations that the Deity has not "made all men for naught"?

But on entering upon this investigation, we cannot but notice the distinction that exists between man and the rest of animated nature. Whilst others of God's creatures are formed to be obedient to instinct, or to bodily appetite, it is man's high prerogative to be endowed with reason and conscience; with the power to cast his thoughts forward to the future, as well as backward on the past; possessed, in a word, of faculties and susceptibilities totally distinct from any of those known to mere animal nature. And whilst these attributes of mind place man in that lordly position which he holds in the universe, the moral and religious apprehensions of which his intellectual nature is capable would seem to require a correspondent elevation of his thoughts toward God. When, for instance, we regard God as creating all things by the word of His power, the very thought ought surely to carry with it a feeling of solemnity. There can be no natural or rational ideas of any thing, if the consideration, that we are never beyond the power and influence of the self-existent, Almighty Creator and Sustainer of all things, do not call forth impressions of profound reverence and awe. For, what good or evil cannot so great and powerful a Being as the Maker and Upholder of the universe do for, or inflict upon, so feeble and helpless a creature as man? In this respect, therefore, the words of inspiration may be appropriately used to express the suggestions of Natural Religion:—"Let all the earth fear the Lord; let all the inhabitants of the world stand in awe of Him; for He spake, and it was done; He commanded, and it stood fast." (*Psal.* xxxiii. 8, 9.)

As in every thing created, also, there are found so many indications of Divine wisdom, and traces of Divine goodness, our reason teaches, that in proportion

Theology. to the excellency and glory of the works should be our admiration of the Maker. Considering, moreover, the extent and magnitude of the Creator's works, and those manifestations of His unwearied providence by which we are surrounded, the Psalmist seems but to give utterance to the feelings of every thoughtful and pious observer of the universe:—"When I consider Thy heavens the work of Thy fingers, the moon and the stars which Thou hast ordained, what is man that Thou are mindful of him?" (*Psal.* viii. 3, 4.) If, therefore, a contemplation of the works of creation do not produce in the mind a feeling of grateful humility, the only inference that it seems reasonable to deduce from the existence of such insensibility is, that it must be to man's reproach if the wonders of creation have been spread out before him in vain!

(10.) If, however, we were to rest satisfied merely with an expression of such devout feelings as those which have been alluded to, we shall certainly fall short of much that right reason would suggest to us. For when we consider that it is God "who hath made us, and not we ourselves," there is suggested to us God's right of ownership as it respects man, as well as regards the rest of the works of creation. But what a train of consequences does this thought bring with it! When we can claim any thing as the fruit of our own invention, care and industry, all men admit that we may justly call that our own; that we may, without prejudice to the rights of others, claim the enjoyment and disposal of that in which we have thus so indisputable a property. Yet God's right of ownership in creation may be asserted in an infinitely higher degree than that of man in any of his works. For as it was by an original, uncommunicated, independent power that all things were produced out of nothing, and as creation subsists only by the will of the Creator, it is the high prerogative of the Great Owner of all to place His creatures exactly as seems best to His divine wisdom; apply them to such uses as He deems to be most fitting for them; transfer or take away any thing, or all, which He only originally gave!

Now, if the law of an intelligent nature be to do whatever is agreeable to the relationship in which it is placed, there follows, from the notion that we are "God's workmanship," that we should at once deliberately resign ourselves to His disposal, without hesitation or reserve; that our wills being thus subordinated to that of our Maker, we should be content to abide by His allotment of our condition in this life, in whatever station or circumstances we may be placed: for as we can claim nothing as our right, we ought to receive every thing as a free gift. Man also being the property of the Creator, it follows that the right of self-disposal can extend no further than it has been conceded to us by our Maker; and that we may not employ the faculties and endowments of our mind, or the members of the body, in any manner that God has not sanctioned. As respects our worldly possessions, also, we are not entitled to use them except with reference to the purpose for which they were committed to our custody. And, finally, none can rightly presume to dispose of other men's goods, but as the Maker and Owner of all has been pleased to assign to each their several measures of authority and subjection.

(11.) We are thus, further, led to regard the Deity as a Supreme Ruler and Legislator, whose dominion is without bounds, and whose sovereign authority is beyond control; whilst the whole human race must be con-

Theology. sidered as members of one vast community, the characteristic of which is subordination; all rational intelligences being subject to one and the same Lord, and, under Him, to each other as right reason may suggest. The duties also that arise out of this relationship, though manifold in act, will yet be, in principle, analogous to those which are admitted to be inseparable from all well-governed communities: only, as the economy of the Divine government is conducted on far higher principles of truth and equity than is possible in the most perfect of human sovereignties, and as the object of every government is to mould the character of the subject into the spirit of its laws, it follows that our duty to our Maker and to our fellow-men must be measured by the standard of God's dealings with His creatures, and not by the rule of human selfishness.

It is almost unnecessary to remark, that there is implied in the ideas which have been thus briefly developed, a desire on the part of man to acquaint himself with the perfections and will of this great Lord of the universe. We cannot intelligently revere a sovereign of whom we know nothing; nor can we yield a rational obedience to laws of which we are altogether ignorant. It is the part of a reasonable being, therefore, to trace out manifestations of the Deity wherever they are to be found, and to collect and treasure up every intimation of God's will, in what manner soever it may have been conveyed.

Duty of gratitude.

(12.) It is not, however, so much the consideration of that absolute dominion which the Deity exercises over the works of His hands, in virtue of creative power, that challenges the obedience and services of His rational creatures, as the conviction that we are the object of His boundless goodness. Wherever we turn our thoughts we find ourselves still encircled with Divine beneficence. For man's sake the earth is decked with varied garniture—affords him gratification to every sense, and provision for every want. The heavens above, and the waters under the earth, minister of their kindly influences, and contribute liberally of their stores. The whole course of nature is, in fact, but a transcript of the Almighty's regard for His rational creatures. Now, although many selfish considerations may intervene to blind man to those obligations which arise out of ownership and sovereignty, yet the claims of a benefactor appeal so directly to what may be called the better feelings of the human heart, that there is no relationship so vividly apprehended, and the neglect of the duties arising out of it more generally condemned. It is the observation of St. Augustine,* that if after fashioning the marble into a human figure, the sculptor could inspire it with life and feeling, and give it motion and understanding and speech, we cannot imagine but that the first act of the figure thus made instinct with all the attributes of the living man, would be to prostrate itself in thankful subjection at the sculptor's feet, and offer to him whatever it might be or could do, as but its bounden obligation to him who fashioned and imparted to it all it possessed. And if the promptings of nature thus be to move us to love those who have manifested regard for us, the power of gratitude may reasonably be expected to call forth in us a sense of the obligation we owe to Him who "breathed into our nostrils the breath of life, and is now daily pouring His benefits upon us." On the other hand, to undervalue God's benefits, or to demean ourselves as if indifferent to His

goodness, would argue a sottishness of character utterly unworthy a rational soul. For whatever difference of opinion may obtain as to what those acts of worship are which Natural Religion teaches man to offer as likely to be well pleasing unto God, there can be no question but that the same law which demands that we should study how we may best gratify our benefactors, calls upon us continually to aim at doing the good pleasure of our Maker.

(13.) It may, perhaps, be objected that Natural Religion has been made to teach more plainly the relationship in which we stand to God and to each other, and our resulting duties, than is really the case; and that man's responsibilities, regarded as a merely rational creature, have been proportionately exaggerated. Nor need it be doubted but that, in the discussions of questions of a moral nature, we are far more influenced by our familiarity with revelation than we are oftentimes conscious of. Whilst, however, it seems to be preferable thus to allow to Natural Religion every advantage to which, under the most favourable circumstances, it can fairly lay claim, it might confidently be maintained, that even if estimated by the lenient demands of heathen codes of morality, the responsibilities of man would be found sufficiently numerous. The only question is, to what extent have his moral obligations been regarded, and his recognised duties performed?

(14.) And here we are confronted by the fact, from whatever cause it may proceed, that, coupled with our acknowledgment of duty, there is in all, more or less, a backwardness to attend to it. Hence it is universally found, that however busily the human intellect may exercise itself about other matters, its inquiries after the Most High are but few and limited; that the sacrifices of praise and thanksgiving are therefore offered with reluctance or dislike, if not supplanted by deeds of impiety; that the sovereign authority of the Almighty is treated with negligent disregard, if not resisted by overt acts of rebellion; that the manifestations of God's providential dispensations and fatherly care do not call forth in man's heart correspondent emotions of gratitude, if they be not made the subjects of murmuring and discontent. So, again, however persevering man may be in following out purposes which accord with the suggestions of the lower propensities of his nature, he is habitually unstable as regards his moral resolutions. If, in fact, a judgment were to be formed of the state of man's soul by inward experience, as illustrated by those outward acts which meet the eye, it would seem as if reason had either laid aside its dominion, or else were unable to enforce its commands. There is, in a word, a perpetual conflict going on between reason and sense; and this not merely under the disadvantages of ignorance, but in spite of the best moral instruction, and the fullest conviction of the importance of obedience to just laws. Man being thus at war with himself, it is the less to be wondered at, that he should not only neglect, but become injurious to his neighbour. And, therefore, we read in the Statute Book of every age and nation the history of that "malice and envy, that hatefulness and hating of one another,"* which has characterized man's social life from the beginning unto this day. The result of all is, that under the most favourable point of view, it will have to be acknowledged that all have more or less failed to

Serm. de Verb. Domin.

* Tit. iii.

Theology. perform their acknowledged duty to God and to man. In some respect or other, all have also violated those rules of right which reason and conscience urge us to observe. In other words, every man, in having done what he knew or might have known to be wrong, and in having neglected to do what he knew or might have known to be his duty, stands CONVICTED OF SIN.

(15.) But as "we see the whole world and each part thereof so compacted that as long as each thing performed only that work which is natural unto it, it thereby preserveth both other things and also itself; and, contrariwise, that if any principal thing, as the sun, the moon, any one of the heavens or elements, but once cease, or fail or swerve, we easily conceive that the sequel thereof would be ruin, both to itself and whatsoever dependeth on it; is it possible that man, being not only the noblest creature in the world, but even a very world in himself, his transgressing the law of his nature should draw no manner of harm after it?" (Hooker, *Eccl. Pol.* i. 9.) An answer to this all-important inquiry is supplied by the fact, that the experience of mankind has so surely connected difficulties and sufferings with the neglect or violation of man's duties to himself and to society at large, that motives to practise general rectitude and integrity, on the score even of common prudence, are to be found embodied in the proverbs of all nations. And if punishment be thus palpably the admitted result of offences against those natural laws which regulate man in his individual and social capacities, there can be no obvious reason assigned why man's duty to God may be neglected with impunity. Indeed, if it be allowed that we owe any duty to God at all, the neglect of that duty being a neglect to fulfil some of those purposes for which man was created, is so far to introduce disorder into the universe. The same reasons, therefore, which would assign retribution to the violator of those laws on the observance of which the course of this world is made to depend for its well-being, would lead to the conclusion that offences against God also will not pass unrequited.

Retribution.

These, and other considerations which might be adduced, clearly warrant the inference, that none can depart from rectitude, or neglect the performance of duties, without exposing himself to the righteous displeasure of that Almighty Being who, by the very act of prescribing laws to the creatures of His hand, declared it to be His will that those laws should be obeyed. The tendencies of man's moral nature, also, all bear witness to this truth; for the shudderings of fear, and the forebodings of conscience respecting the probable misery consequent on misdoing, are but so many indications that there is some judgment in store for every one that doeth evil, whether that evil have reference to the Creator or the creature.* Then follows the appalling thought, that in whatever obscurity and difficulty the subject may be involved, yet the contemplation of man's intellectual nature discovers to us unquestionable intimations that there will be a future state of existence.† But as our habitual consciousness assures us that, amid every external or mental transition from state to state, the soul, as to all that constitutes its essence and responsibility, remains always the same, what reason is there for believing that our destination to a future state can become to us any thing better than

Theology. a continuation of that displeasure of God which in this life we have such just cause to apprehend?

And yet it does not appear, on principles of human reason, how man can rid himself of this well-grounded apprehension of the Divine judgment. For if we should hope for reconciliation with God simply on ground of His mercy and goodness, our reason would remind us, that offences, merely as offences, can have no claim upon the Divine forgiveness, except at the sacrifice of those great principles on which the stability of all government depends. If we should hope for pardon on account of any thing we could do, or for any sorrow and amendment that we might manifest, who can tell us the exact amount of service to be performed? or that it is an established rule of the Divine government to free the evil-doer from punishment whenever he may repent and amend his life? On the contrary, those superstitious rites which heathen nations have practised shew, by their very number and variety, how little competent the human mind is, when left to itself, to decide upon what are, and what are not, fitting means to propitiate the Deity; whilst it is an every-day observation, that penal consequences continue to pursue the offender long after his crimes have been repented of and forsaken.

(16.) Although, therefore, Natural Religion may serve the important purposes of bringing us acquainted with many of those duties which arise out of the relationship in which we stand to the Creator and to our fellow-creatures, it fails to disclose how that demerit which is consequent upon a neglect of those duties can certainly be removed; and how man may be restored to the lost favour of his Maker.

Natural Religion being thus defective as regards a subject of all others the most important to man as an accountable, yet sinful and immortal being, the necessity for some direct revelation from God has, in all ages, been felt;* that by this means the mind of man might be authoritatively assured on what terms the Creator would pardon His offending creatures, and how far that forgiveness would extend.

(17.) It becomes, therefore, the duty of every rational man to inquire whether any such revelation has been made?—by what proofs man may attain to a certain conviction on this important question?—and how he may ascertain the sum and substance of this communication from God? These inquiries will form the subject of the next chapter.

* See the remarkable indication of such a desire in the celebrated passage of Plato towards the end of the second *Alcibiades*.

We may state here that, if space had permitted, we should gladly have referred to the writers of antiquity for the illustration of many sentiments contained in the preceding pages. We must, however, recommend Cicero's *Treatises, De Natura Deorum*, lib. ii., and *De Legibus*; and, also, Xenophon's *Memorabilia*, lib. i. 4, and lib. iv. 3. The authors who, like Seneca, lived after the incarnation of our Saviour, contain many things worthy of notice on the great truths of Natural Religion; but we believe they are more indebted to the light reflected by the Christian Revelation than is usually allowed. In the quotations referring to a future life, adduced by Leland, &c. to enforce the necessity for a Divine Revelation, the uncertainty of the heathen, in speaking of a future state, seems rather to express their misgivings as to what might be their condition in that state than any doubt as to the state itself. Our impression is, that the idea of an hereafter is inseparable from the human soul, whatever external disadvantages it may labour under as to instruction. (S. Tertullian. *De Testim. Animæ*, ch. iv.) We cannot follow out the subject here, but we must regard it as deserving of more attention than it has yet received.

* See the testimony to this power of conscience in Juvenal, *Sat.* xiii. 2 and 192, *et seq.* † Turton, *Nat. Theol.* p. 188.

OUTLINES OF THEOLOGY.

CHAPTER II.—EVIDENCES.

Evidences.—Revelation.—Scripture.—Tradition.—Fanaticism.—The Rule of Faith.

Theology. (1.) THE first inquiry which we now propose to institute is, to ascertain whether any such Revelation as that alluded to in the close of the last Chapter has been given to man; and whether it is contained in the *Bible*; and, secondly, whether it is contained *only* in the *Bible*.

Natural government of God.

The first point is chiefly a question of evidence; but before we inquire into the particular evidence for any revelation whatever, some few preliminary observations are requisite. If we have before us so large a book from the hand of the Almighty as the Natural World, it is reasonable to endeavour to gather from it some hints as to God's method of dealing with man. It is at least likely to preserve us from the error of forming unreasonable expectations, as to what revelation may be presumed to do for us; and it may furnish us with reasons for not rejecting a revelation as coming from God, on account of difficulties similar to those with which we are surrounded in the natural government of God.* Assuming, then, that the course of nature is a system under the government of God, we are enabled to discern some great principles which characterize it. It will hardly be denied by any who agree to this statement, that there is some degree of probability, that our existence does not terminate with our present life.† But if it be granted that a future state is in any degree probable, a very important question arises, how we may best secure our interest in that state? We observe, that the constitution of nature admits of misery as well as happiness; and that both these are the consequences of our own actions, which consequences we are enabled to foresee. Should rewards, therefore, and punishments in another world depend on our good or ill behaviour here, it would only be an appointment of the same kind as that which we observe in the Divine government according to the regular course of nature.‡

Moral government of God.

But if we carry our observations a little further, we

* The very brief summary of Bishop Butler's argument, which follows, is chiefly a condensation of Bishop Halifax's Preface, compared with the *Analogy* itself.

† The brevity with which we are compelled to treat this subject prevents our entering into the proof of the second proposition. We must refer to Bishop Butler's *Analogy*, ch. i. for a very luminous statement of the question. It must be remembered that he is not demonstrating the *certainly* of a future life, but arguing that it has some degree of probability. This he does from natural considerations only, which suits the course of his argument; but if we take in, as in this state of our argument we may, moral considerations also, from the nature of the Deity and of man, the probability is placed upon a much higher footing.

This is not, however, the point in the argument which we are chiefly concerned to demonstrate. Our object is simply to call attention to the analogy between the system of Nature and that of Revelation. (See Clarke's *Evidences of Natural and Revealed Religion*, vol. ii. prop. iv.)

‡ See Butler's *Analogy*, part i. ch. ii. Butler particularly insists on the government of God by *punishments* in the natural world, as that is the most frequent subject of objection.

may perceive that this natural government of God is a moral government also, in which rewards and punishments are the consequences of actions, considered as virtuous and vicious. It is indeed imperfectly so, as the essential tendencies of virtue and vice to produce happiness and the contrary are often hindered from taking effect; but it appears to contain the rudiments of a righteous administration, under which, in a more perfect state, the rules of retributive justice will more completely obtain.*

This moral government also implies the notion of some sort of trial, or a moral possibility of acting wrong, as well as right, in those who are the subjects of it. By this the doctrine of religion, that our present life is a state of probation, is rendered credible, as being analogous to this moral government; prudence being required to secure our interest here, as virtue is requisite to secure our eternal happiness. But this is not all; our present life is also a state of discipline and improvement, each part of our life being a state of discipline for that which succeeds it. By this means, the formation of habits of piety and virtue is promoted, which are, besides conscience, of great use to creatures in a state of moral imperfection, as a safeguard against the dangers to which we are exposed.†

(2.) Objections will, however, arise against the wisdom and goodness of the Divine government, to which analogy, as shewing only the truth or credibility of facts, affords no complete answer; but it suggests to us that the Divine government is a scheme or system, not a series of unconnected facts. The government of the natural world appears to be such a system, and seems to bring about *ends* by *means*, which we might *a priori* have judged likely to have a contrary effect: it is carried on by *general laws*, whose utility we are enabled to discern, but are utterly incompetent judges of the *whole*, because we see so small a part of it. If, therefore, the moral world be a similar system, and still more, if the two together form one great scheme, we shall be obliged to acknowledge ourselves unable to judge of the whole, from our incompetent knowledge of the whole, or even of the mutual bearings of the several parts of it. All objections, therefore, to the goodness and wisdom of the Divine government may be founded merely on our ignorance, and to such objections our ignorance is the proper and satisfactory answer.

(3.) These considerations apply primarily to Natural Religion, but they are of great service towards forming right views of Revealed Religion also. The importance of Christianity to man cannot be over-estimated, when we consider that it is,—

* See Butler's *Analogy*, part i. ch. iii.; comp. Clarke's *Evidences*, &c. *ubi supra*.

† See Butler's *Analogy*, part i. ch. iv. and v.

Theology.

1st. An authoritative republication of Natural Religion, confirming its most important doctrines, and,

2ndly. The Revelation of a new dispensation of Providence, originating from the pure love of God, and conducted by the mediation of His Son, and the guidance of His Spirit, for the recovery and salvation of mankind represented as in a state of ruin.

Presumption
against Re-
velation in
general.

(4.) Now the presumptions against Revelation in general are, that it is not discoverable by reason, is unlike what is so discovered, and that it is introduced and supported by miracles. It is far from being true, that it is so wholly unlike what we may observe in the constitution of nature; but even if it were, our knowledge of the whole is insufficient to entitle us to make this an objection to so wide a scheme. Nor is there anything incredible in Revelation, as being miraculous, whether miracles be supposed performed at the beginning of the world, or after a course of nature is established. Not at the *beginning of the world*,* for something of a miraculous kind *must* have happened then. Not *after the settlement of a course of nature* on account of miracles being contrary to that course, as being contrary to experience. We have no parallel case to compare with this, and ascertain whether God would attest a revelation by miracles.

Particular
objections
to Christi-
anity.

Presumptions against revelation in general being disposed of, the foregoing principles enable us to answer the usual objections against Christianity in particular, as distinguished from objections against its evidences.

1. Because it contains many things which beforehand appear to us liable to objections, and is different from what we might have expected; as, for example, its late appearance in the world, and its want of universality.

Ans.—This part of the system has its counterpart in the natural world. We might have expected remedies for all bodily diseases, but they were long unknown, and are now known but to few.

2. Christianity is a scheme imperfectly comprehended by us,—a consideration which answers objections from any seeming want of wisdom or goodness in it, just as the same objections were answered in regard to the constitution of nature.

3. The restoration of mankind, as shewn in the Gospel, required a long series of means and contrivances, whereas it ought to have been brought about at once.

Ans.—Everything we see in the course of Providence shews us the folly of this objection, for all ends are there brought about, not directly, but by a succession of means.

4. The mediatorial scheme and the vicarious punishment, which the scheme of Christianity presents to us, are sometimes objected to.

Bishop Butler, in answer to this, points out instances in which the visible government of God is administered upon analogous principles. A sinner is not always pardoned and freed from inconvenience on simple repentance, but provisions are made, even in nature, by which the miseries men have entailed on themselves are removed or mitigated, sometimes by extraordinary exertions on their own part, but more frequently by the intervention of others, who voluntarily submit

to much inconvenience and suffering, as the price of rescuing their neighbour, and thus furnish a natural instance of vicarious punishment being available to good.

5. The want of universality and the want of intuitively clear evidence for Christianity, are lastly made grounds of objection.

Ans. 1. The gifts of Providence are dispensed unequally, and even if Christianity had been universal, the diversity of men's abilities, &c. would soon have rendered it unequally distributed; and men will be judged according to their light.

2. As we are obliged, in life, to act upon probability, we have no right to look for an intuitive knowledge of the truth of religion. The proof we have is amply sufficient in reason to induce us to accept it, and dissatisfaction with it may be our own fault.

The above hints will enable us to see how much use may be made of the observation of God's natural government of the world, in obviating objections to the Christian Revelation. It affords somewhat of a presumption in its favour, that it really provides the very remedy which Natural Religion (*see the close of the last Chapter*) impels us to desire, but fails entirely to point out, a means of restoration to God's favour and of holiness; it holds out the hope of justification and sanctification to man exactly where his inquiries into Natural Religion leave him without comfort or remedy.

These considerations are entirely preliminary; but they are sufficient, if fairly carried out,* to justify us at once in turning our attention to the particular evidence for Christianity; and in concluding, with Bishop Butler, that objections against Christianity, as distinguished from objections against its evidence, are frivolous. We proceed, therefore, now to sketch out a slight view of some of the evidences for the truth of the *Bible*: in so doing, as we must *select* from a large variety of arguments with which God has mercifully supported his religion, we shall endeavour to use those which will give us the widest views of his dealings with mankind, and of the preparation which he made of old for Christianity.

β. Particular Evidence for Christianity.

(5.) In reasoning on the evidence of Christianity, we have great reason to be thankful both for the variety of the proofs by which the Almighty has been pleased to support it, and for the simple and obvious facts and principles on which they are grounded. The first matters on which we are about to found our chain of reasoning are easy of proof, and admit of very little hesitation. The foundation of Christianity was laid long before its Great Author came into the world, and the *great facts* of the Jewish dispensation—and our argument will require only these to be established—are supported by an evidence wholly irresistible.

It cannot be disputed that at the time in which Christianity arose, a nation was in existence, called the Jewish nation, which claimed to be the depository of a revelation from God; that this revelation was written in the *Old Testament*, and contained what were then

* There was then no *course of nature* to be contradicted by miracles. See Campbell on *Miracles*, on these two points. He shews that a miracle *must* have taken place at some period, if miracle means deviation from the course of nature.

* As they are in Bishop Butler's *Analogy*, to which these outlines form only, as it were, a table of contents. That work is one which is indispensable to every one who wishes to have an accurate, as well as comprehensive, view of God's dealings with mankind.

Theology. believed to be a series of prophecies, and that these prophecies had awakened in that nation a general expectation of some great person, who was to arise as a deliverer to the nation. It is equally indisputable that this nation professed obedience to a ceremonial law, which they attributed to Moses, and which they considered him to have received from God. There are facts so certainly known and universally acknowledged as to require no proof. And if we pursue this subject further, we shall find that this law, as contained in the *Pentateuch*, must have been in existence for many centuries, and that the whole body of the *Old Testament* had been translated into the Greek language nearly 300 years before the coming of our Saviour. We will not now argue from these statements to the Divine teaching of this people. The superiority of the Jewish people, as regards their religious views and their moral code, compared with their inferiority to the great nations of antiquity (as the Greeks and the Romans) in all besides—in the elegancies of literature and the arts of life, is a phenomenon which admits of easy explanation, when we deduce their moral and religious code from a Divine revelation, but presents most formidable difficulties on any other hypothesis.

Antiquity of the Old Testament. But leaving these considerations, we proceed to point out some other extraordinary circumstances relative to the *Old Testament*. It is written in a language which was ceasing to be a living language, nearly about the time when historical writing began in other countries. The *History of Herodotus* was about contemporary with the latest Hebrew book; and the language in which Malachi was written, was just then beginning to give place to a kindred dialect, if it had not been superseded by it.* Historical considerations shew us that the *Pentateuch* (certainly the oldest† part of the *Bible*, unless *Job* be thought of the same age, though that is not likely,) must have an antiquity far transcending this epoch.

The Pentateuch.

Without laying any stress upon the existence of the Samaritan *Pentateuch*,‡ and the reception of that portion only of the sacred volume by the Samaritans, no person acquainted with the facts of History and Philosophy could suppose the *Pentateuch* to have an origin posterior to the time of Ezra; nor can the law then have been a new series of obligations. The facts of History

* Gesenius (*Geschichte der Hebräischen Sprache und Schrift*, part i. sec. 13) denies the usual interpretation of Nehemiah, ch. viii., v. 8, and considers that מְפָרֵשׁ does not mean translating into a different dialect; but simply explaining difficult passages. But Gesenius is not an authority to be implicitly followed in that work. He there attempts to shew that the writer of the *Book of Chronicles* misunderstood the Hebrew of the *Book of Kings*; but his attempt is most rash and unsound. See Rose's *Hulsean Lectures*, Appendix.

† Philological considerations shew this also. Gesenius acknowledges it with regard to all but *Deuteronomy*; but see the observations at the end of this paragraph.

‡ Dr. Graves has made this the first step in his argument for the antiquity of the *Pentateuch*, as proving its existence prior to the breach between the two parties. But Hengstenberg, in his *Die Authentie des Pentateuchs Erwiesen*, &c. 2 vols. 8vo. (the latest and most elaborate defence of the *Pentateuch*), considers this an unsound and useless argument.

Professor Hengstenberg quotes most of the previous writers who have treated these questions, so that a reference to his work is sufficient.

There are some useful arguments in Professor Blunt's *Veracity of the Books of Moses argued from the Undesigned Coincidences to be found in them*. Also in the *Lettres de quelques Juifs*, &c.

Theology. compel us to admit that it must have been recognised long before the Captivity, as the law of at least the kingdom of Judah. Professor Hengstenberg has lately investigated the question of its reception in the kingdom of Israel, as shewn by the books of Kings, and by indications in the books Hosea and Amos, the two prophets who chiefly addressed themselves to Israel. To his researches, and to Dr. Graves, we must refer those who wish to trace the *Pentateuch* up to the time of Moses.

Observation.—We have (after an examination of most of the celebrated German writers on the subject) very little confidence in the dicta of modern philological scholars as to the difference in dialect and epoch between various portions of the *Old Testament*, as shewn by their style and diction. Gesenius (*Geschichte*, &c., ut supra) divides the *Bible* into books written before and books written after the Captivity, and contends that there is a clear distinction in their style and language. Other philologists bring down the *Pentateuch* to the Captivity. Now these marks of difference either exist or they do not: if they do, the latter philologists are worth nothing; if they do not, the other mischievous views of Gesenius, which rest on this foundation, are worth little attention. There are one or two peculiarities in the *Pentateuch*, which seem decidedly archaisms, but great care is needful in arguing from internal evidence of style.

For further details on this subject, see the Appendix to Rose's *Hulsean Lectures*, and Professor Hengstenberg's work above cited.*

If now, after shewing the antiquity of this volume of the *Old Testament*, we examine its contents more accurately, we find that it contains a large number of passages, claiming to be delivered as prophecies by men inspired by God, and commissioned to deliver these messages. We find also two classes of these prophecies, one of them relating to the destinies of neighbouring nations, the other to the condition of the Jewish church and its relations with the heathen world; in which last class we reckon, of course, the prophecies relative to the Messiah.

We may safely assert, that when we compare these prophecies with their fulfilment, no human composition can rival them. The Jews were much connected with some of the most remarkable nations of antiquity, e. g. with Tyre, with Babylon, and with Egypt. Now of these nations the fate was predicted at least 2400 years, in terms which describe their present condition as accurately as if written by a traveller at the present day. For Tyre, see *Isaiah* xxiii., *Ezek.* xxvi. xxvii.; for Egypt, *Ezek.* xxix. (especially v. 15) xxx. xxxii.; for Babylon, *Isaiah* xlii., especially v. 19, 22, &c.

This list of prophecies, the actual fulfilment of which challenges our attention, prior to any proof of inspiration, might be considerably increased by those relating to Nineveh, Edom, the Arabians, (*Gen.* xvi. 10, 12,) and the prophecies of Daniel respecting Greece and Rome; but we shall mention only one more, because it is remarkable as the oldest prophecy on record, with regard to the nations of the world: we mean the curse pronounced on Canaan, *Gen.* ix. 25. It is remarkable that no Canaanitish nation has ever yet maintained a pre-eminence in the world, while the descendants of Ham are still the storehouse of slaves for all the nations who have not yet abolished that infamous traffic, the slave-trade.

The prophecies, also, regarding the destruction of Jerusalem and the dispersion of the Jews, the latter of

* See also Bishop Herz's tract, *Sind in den Buchern der Könige, Spuren des Pentateuchs und der Mosaischen Gesetze zu finden?* Altona, 1822. This was written in answer to *De Wette*, and has been used by Hengstenberg.

Theology. which continue to give a wonderful testimony at the present day, are another class of external evidences, which challenges the attention even of the most careless observer.

With regard to the prophecies alluded to in this section, we may just refer to Bishop Newton on the prophecies, from which most subsequent works on the subject have been compiled. There are some very useful observations on this point, also, in Mr. Davison's *Discourses on Prophecy*, especially Discourse xi. His Discourse xii. treats of Daniel's Prophecy of the Four Empires.

The promise of the Messiah.

(6.) Let us now turn our attention to the second class of prophecies, of which we spoke. It is easy to shew that, throughout the *Old Testament*, there is a continued reference to a promise, which was to prove of most extensive benefit to the human race. This promise is said in the first instance to have been made by the Supreme Being to the first parents of mankind, purporting that certain privileges forfeited by them should be restored in the person of one of their descendants, described there as the seed of the woman. (*Gen.* iii. 15.*) This promise is continually renewed throughout the volume, every fresh intimation of it being usually accompanied by some additional circumstance, which serves to limit it, to clear up and define its meaning, until at length it can only be understood to indicate the approach of some great and mysterious Being. (*Gen.* iii. 15; xii. 1, 3; xxvi. 18; xlix. 10, 11; *Deut.* xviii. 15, 18; *Isaiah* xi.; *Malachi* iii. 1; iv. 5, 6,† &c.) The names by which this exalted person is described, besides the peculiar title of Messiah (*i. e.* Christ, or the Anointed), are very remarkable: 'Thy King cometh,' 'The Son of God,' 'The Lord our Righteousness!' (*Zech.* ix. 9; *Psalms* ii. 7; *Jer.* xxiii. 5, 6.)

On a still closer examination, we find the nature of the Revelation, of which this messenger was to be the bearer, disclosed with much clearness as to its leading points. It was to be a dispensation, in which an atonement and reconciliation was to be effected between man and his Maker.

Again, the false religions of the world were then to disappear, the idols to be abolished, the kingdoms of the earth were to become the kingdoms of the Lord, and the earth was to be covered with the knowledge of the Lord.

Again, the dignity of the messenger was to be even greater than that which we have heretofore expressed. He is called 'Wonderful;' 'the Mighty God;' 'the Everlasting Father;' 'the Prince of Peace.'

Isaiah liii.

But although the nations were to be blessed in him, though his dominion were to be so wide, yet he was to have no earthly glory at his appearance, "no beauty that we should desire him:" he was to grow up silently like a tender plant; he was to be a man of sorrows and acquainted with grief; he was to be led as a lamb to the slaughter, and to make intercession for the transgressors, and he was to yield his soul an offering for sin. Beside all this, without reference to the

* This promise was given in the curse pronounced upon the serpent. The mistranslation of the Vulgate "*ipsa*," by which it is transferred to the *woman* instead of her seed, is well known. The Hebrew text entirely rejects this corruption, though the *pronoun* (by an archaism found in the Pentateuch) is common, the *verb* is in the third person masculine, which settles the question. The *ejus* of the vulgate is indefinite, but the affix in Hebrew is masculine also.

† It must be remembered that the references here given are only sufficient to point out the great features on which the argument depends. An adequate collection of prophetic passages from Scripture would occupy some pages.

Theology. promise itself, there are many circumstantial prophecies relative to the time at which the Mediator of the new covenant was to come into the world. The place of his birth, the time of his appearance, and a multitude of minor circumstances personally characterizing him are added, which it is superfluous to enumerate, but which designate him very definitely.*

The above brief indications of the nature of the prophecies relating to the kingdom and person of the Messiah are all which our limits allow us to bring forward; but though these be sufficient, yet the argument rather suffers from the paucity of citations.

When the prophecies are collected fully, and accurately arranged, their force is overwhelming.

The types also, the paschal lamb, the brazen serpent, (acknowledged by the Jews to be typical,) the sacrifices of the law, and the rest of the typical pre-figurations of our Lord, might justly be adduced, but we are desirous of bringing forward only those passages, the prophetic nature of which does not admit of dispute. A good *Christology* of the *Old Testament* would be most valuable. We have not examined Professor Hengstenberg's *Christologie des Alten Testaments* sufficiently to speak of it decidedly, but his other works have given us a very high opinion of his powers. Bishop Kidder's *Demonstration of the Messiah* is a very valuable work. Robinson, on the *Prophecies* relating to the Messiah, is a mere practical application of most of the passages, and is not argumentative or illustrative. To be of real value, however, such a work must be written with very wide knowledge and great judgment. Every English compendium gives us a list of passages arranged under heads relating to the offices, &c. of Christ. These are sufficient for all common purposes, as God has mercifully taken care to write his lessons to mankind very clearly.

(7.) We are now about to apply these observations which we have made respecting the *Old Testament* to the facts recorded in the *New*. We presuppose in our readers a general acquaintance with the history and the contents of the *New Testament* and the early history of Christianity. But we may as well observe, that here our argument does not absolutely require a proof of the genuineness and authenticity of the Gospels. The main outline of the history of our Saviour might satisfactorily be made out from other writers, even if the Gospels had been lost to us. Christianity itself is a phenomenon which requires to be accounted for by a sufficient cause, and certainly none is adequate which does not imply that its first founders believed that the story on which their faith was founded was a miraculous one. And we could show from independent authority that the story which they did believe resembled that given in the Gospels; and the early propagation of the faith is a well-known matter of history.

The proof of the assertion respecting the main facts of the Gospel would occupy too great a space, as its value depends on details. But for a sufficient demonstration of it we have only to refer to Paley, *Evidences*, part i. ch. vii., and to Archdeacon Lyall's *Propædia Prophetica*, lect. p. 136 to 151, to which last work we are much indebted in the course of this argument. These references supersede the necessity of others.

(8.) Assuming then, after the proof referred to, that the Accomplishment leading facts recorded in the Gospel were believed by its first teachers, we may point to the fact of the success of Christianity, as the most remarkable accomplishment of prophecy which the world has ever beheld. This new and spiritual kingdom was set up: it arose at the very time predicted, and before the destruction of the Temple, which took place soon afterwards, and thus intimated that the time had passed for the coming of the Messiah. (See *Malachi*, iv. 1.) It banished idolatry, ere

* The time of his coming is determined by Daniel in the celebrated prophecy of the *twenty-two* times, and by Malachi it is restricted to the times of the Temple.

Theology. long, from most of the accessible quarters of the world, and gave a general religious knowledge to the nations of the world, such as had never even been dreamt of before. These were contingent events quite beyond the control of man, and far beyond his unassisted wisdom to predict. This forms one great branch of the argument, and the personal history of our Saviour forms another. Many of the prophecies accomplished in his life are in some degree obscurely expressed; but had these marks been too plainly set down, the malice of man might have attempted to evade them.* These, which were not absolutely recognised beforehand as prophecies, may be called imperfect prophecies; those which were, perfect prophecies. The perfect prophecies were clearly fulfilled, if the great and leading events of our Lord's life, as believed by his first followers, really took place, and the imperfect ones are so many and extraordinary as to strike our attention very forcibly, even if considered alone. We are here entitled to ask, even before we assume or prove the authenticity of the Gospels, whether all this can be the result of collusion or of chance? Can the prophets, so remote in time from each other, have been engaged in any collusion? Can they have engaged the Apostles to assist them, at the risk of their lives, their fortunes, and their reputation? Can it have been the result of chance? Has chance ever made such a chain of prophecies, extending to such distant generations, and produced their accomplishment? Again we are entitled to ask, can the conduct of our Saviour and his Apostles be accounted for on any principle of enthusiasm or imposture? The very thought is absurd! But even if it could, would this explain the accomplishment of all these prophecies, and the success of our Saviour, who must, on such an hypothesis, be accounted an ordinary peasant of Galilee? Yet these are only a few of the earliest difficulties which meet us, in any attempt to account for the phenomena of Christianity on any hypothesis but the simple one of its truth and Divine origin. We cannot conclude this portion of our argument better than by the words of St Augustine:—

Venit Christus; complentur in ejus ortu, vita, dictis, factis, passionibus, morte, resurrectione, ascensione, omnia praeconia prophetarum.† “Christ came; in his origin, life, sayings, doings, sufferings, death, resurrection and ascension, all the predictions of the prophets are accomplished.”

Truth of the Gospel. (9.) But we are not reduced to such meagre evidence for the principal facts of the Gospel history. The genuineness and authenticity of the *New Testament* rest on evidence which cannot be gainsaid; and the testimony by which the miracles of our Lord are accredited is absolutely and entirely distinguished, by its strength, from that which supports any other miraculous accounts. The work of Paley has completely proved this point; and indeed so confidently

* The multitude of marks which concur to prove our Saviour the intended Messiah, and which agree with no other person, have often been pointed out. This is done with great clearness and ability by Archdeacon Lyall, in his *Propædia Prophetica*, Lecture vii. p. i., who has pointed out such marks as might have been evaded if too prominently set forth before their fulfilment; e. g. the gall and vinegar, the thirty pieces of silver, the time of our Saviour's crucifixion, &c.

Indeed, the whole of the *Propædia Prophetica* is deserving of great attention, as shewing the place prophecy holds in the argument for Christianity.

† Augustin. in *Epistol. Voluntiano*. Opp. tom. ii. p. 6, edition 1616.

Theology. do Christians trust to this evidence, that writers upon evidence in modern days usually consider it sufficient to bring forward the evidence for the facts of Christianity, (both the ordinary and the miraculous events recorded in the *New Testament*), and they conceive the proof to be complete. We may certainly so far accede to their views as to grant that if evidence ever established the title of any facts whatever to our credence, these are supported by the most unexceptionable and overwhelming mass of testimony, and that the arguments adduced by Paley and others completely prove the truth of the facts. But upon this point it is unnecessary to enter here, because the subject has been so copiously treated in another division of this work. (*Encyc. Metr. Hist. Div.* vol. ii. p. 626, 643.)

In Paley's *Evidences*, the arguments for the genuineness of the *Gospels* and the *Acts of the Apostles* are stated with great clearness and force. The great storehouse is, however, Lardner's book, which Paley has admirably abridged in ch. ix. of his *Evidences*.

The *Horæ Paulinæ* of Paley proves St. Paul the author of the Epistles known under his name, with great ingenuity, and in a manner which entirely settles the question for ever. And if these Epistles be proved to come from him, how strong an independent proof we have in his history of the truth of the Gospel. See Lord Lyttleton's *Essay on the Conversion of St. Paul*.

After all that has been written on the subject of miracles, we shall not add more, except to observe that Archdeacon Lyall, in answering Hume, argues that testimony cannot prove a miracle: it can prove the facts (which he contends Paley's arguments do prove), but cannot shew that they proceed from Divine interposition. Perhaps this is to carry the argument too far, when we consider the nature of the miraculous facts of the Gospel. A person, professing to have a Divine message, and to perform miracles in proof of it, after a judicial condemnation and public death, is raised from the dead, and ascends to Heaven. If the two last facts be included in the proof, surely we cannot doubt that, with this testimony after his death, his message came from God! Archdeacon Lyall has beautifully pointed out the reasons why the Apostles argued more from prophecy than from miracles, and to his work we refer our readers.

(10.) Our first argument therefore is, that, without assuming the truth of the facts believed in the present day and in the early days of Christianity, “the correspondence between the present belief of mankind and that promised revelation, which is the subject of almost every page in certain books of the *Old Testament*, is not a verbal coincidence, but a coincidence of facts—a coincidence between an established belief, about which there can be no doubt, and a previous expectation not less certain, founded on the faith of prophecy.” (*Propædia Prophetica*, p. 145.) “If this were a single prediction, the coincidence might be accidental; but the coincidences here, are not of a kind, and if they were, they are too numerous to admit of this supposition.” (*Id. ibid.*) And yet what middle ground is there between affirming them to be mere chance, and admitting the Divine origin of the religion?

Prophecy, therefore, we contend, is a sufficient proof of the truth of Christianity, and would be so were we deprived of the other great arguments by which its Divine origin is supported.

Again, we contend that the miracles of the *New Testament* are accredited by such an overpowering weight of testimony, that they challenge the belief of every impartial inquirer. Either proof, that from miracles or that from prophecy, is ample and convincing.

But as some minds do not admit so easily the conclusion that miracles of themselves are a sufficient evidence of God's sanction and authority to a religion, we

Theology. further observe, that even to this class of minds the miracles, combined with a previous system of prophecy, offer a proof in every possible respect entirely unexceptionable.

We forbear to touch upon other topics, and to press another class of evidence. We mean the internal evidence for the truth of Christianity from the character of its Divine Author, and the nature of His doctrines. Our purpose was not to give a summary of all the arguments which can be used, but simply to give a sufficient answer to the inquiry, "whether any revelation, such as that alluded to in the close of the preceding chapter has been given to man; and whether it is contained in the *Bible*?" and, as we conceive a sufficient proof has been already afforded that the *Bible* does contain such a revelation, we hasten on to the next portion of our inquiries, by which we propose to ascertain whether this revelation is contained *only* in the *Bible*?

The line of argument which we have taken is very much like that suggested by a work we have frequently quoted, Archdeacon Lyall's *Propædia Prophetica*. We ought, however, to observe, that it suffers much by abridgment, and to point out one or two remarkable features in this discussion. That writer lays much stress on the fact that the prophecies applied in the *New Testament* to our Saviour, were acknowledged by the Jews previous to our Saviour's appearance to be prophetic of the Messiah. He has given a list of the oldest Jewish authorities (none of whom are, however, older than about the second century after Christ) in confirmation of this statement. (p. 100-107.) It must be supposed that these interpretations are probably the traditional teaching of a still more ancient date, and thus they may be brought to the times of our Saviour.

We may perhaps be asked, how then do you answer the arguments of a German neologist, who contends that the *New Testament* is only an accommodation? The first answer is, that it is absolutely incompatible with the facts of Christianity and the character of its first teachers to suppose any such fraud. And, secondly, if men had conspired to meet the expectations of their own days, they would surely have tried the more obvious and more alluring views of earthly glory; and certainly, after the death of their leader, a few uninspired fishermen could never have imposed a religion on the world. They could not have invented the scheme; and even if they could, their success would remain unaccounted for, except by a Divine origin of their religion. Bertholdt's *Christologia Judaica* is the work where this view is most offensively brought forward. Professor Lee, in answering him, denies his premises, denies that he has any proof that the Jewish opinions he produces are as ancient as the times of our Saviour. We must add that, granting his premises, his conclusion is utterly untenable.

We should also wish to call attention to the ingenious supposition made in the *Propædia Prophetica*, of a sealed document which was to accredit an ambassador whose proposals were to be of an extraordinary nature, the sealed document being sent long before his arrival, but not opened till he required its testimony. This, of course, is prophecy, the meaning of which was not fully unfolded till it was fulfilled. But the work itself should be read and well considered by all who desire to understand the nature of the evidence given by prophecy.

We may now mention a few works on the Evidences of Christianity, which are highly valuable, although the course of our argument has not led us to make much use of them.

1. We may refer those who wish for an answer to Deistical objections, to Leland's *View of the Principal Deistical Writers*, &c., and to Bishop Butler's *Analogy*. The Deists generally attacked the *Bible* itself, rather than its evidence; but Butler has shewn (see Section 1 of this Chapter) that such objections are frivolous.

In answer to Gibbon and T. Paine, Bishop Watson's *Two Apologies* are of value; and in answer to Voltaire, the *Lettres de quelques Juifs*, &c., by the Abbé Guenée, ought to be read.

2. Stillingfleet's *Origines Sacrae* (full of matter relative to ancient profane history) will be found very valuable; as also Jenkins' *Reasonableness and Certainty of the Christian Religion*.

VOL. II.

Theology. Leland's *Advantage and Necessity of Revelation*. R. Millar's *History of the Propagation of Christianity*. Arthur Young's *Historical Dissertation on Idolatrous Corruptions in Religion*. Dr. Ireland's *Christianity and Paganism compared*, &c. Rose's *Christianity always Progressive*.

3. On the evidences of prophecy: Bishop Kidder's *Demonstration of the Messiah*. Bishop Chandler's *Defence of Christianity from the Prophecies*, and *Vindication of the Defence*. Bishop Newton, *On the Prophecies*. Hurd, ditto. Mr. Davison's *Discourses on Prophecy*.

4. Internal evidences: Soame Jenyns' *View of the Internal Evidence for Christianity*. Bishop Sumner's *Evidences of Christianity*.

The above are a few of the principal works on the evidences for Christianity. It is needless to mention Paley's *Evidences*, and his *Horæ Paulinæ*, which have already been quoted: they are in the hands of every one who pretends to take any interest in these subjects.

γ Is this Revelation contained ONLY in the Bible?

Having obtained satisfactory evidence that the *Bible* contains a revelation from God, we proceed to inquire whether this is the only authorized and authentic channel through which God has made known His will to man.

The consideration of this question leads directly to an investigation of the claims of tradition.

Christianity is evidently an exclusive religion, admitting of no compromise or co-existence with any other, such as any of the forms of Paganism or Mohammedanism. The question is therefore limited to this point, whether, concurrently with the Holy Scriptures, we have any *other* authentic source of revelation from God within the Jewish and the Christian Church? The Jews and the Roman Catholics both assert that there is, besides the *written* word of God, another, *unwritten* word of God, of equal authority with Scripture, and independent of it. Some bodies of Christians also maintain the necessity of an inward revelation; and others have appealed to miracles and prophecies in modern days, as accrediting special revelations from God. These positions must therefore be severally examined.

In the *Encyc. Metr. Hist. Div.* vol. ii. p. 580, some account is given of the Gentile religions. It has been deemed unnecessary to occupy any space with arguments against Heathenism or Mohammedanism. The latter is treated of historically in the same division of this work, vol. iii. p. 348-362. For a general account of Mohammedan doctrines, Mr. Forster's *Mohometanism Unveiled*, Dr. W. C. Taylor's *History of Mohammedanism*, Sale's *Koran*, and White's *Bampton Lectures*, may be sufficient: but these works, for the most part, give only a popular view of the subject. For a knowledge of the religion of India, we may refer also to *Encyc. Metr. Misc. Div.* article INDIA. Carwithen's *Bampton Lectures*, and Ward's *Hindoos*, are also useful; but for accurate information on this subject, Oriental sources must be consulted. The *Theological Catalogue* of Talboys (p. 314-324) gives an useful list for these purposes. Much information on heathenism generally is found in the works of Stillingfleet, Jenkin, Leland, &c. referred to under the head of Evidences.

1. Jewish Tradition.

The doctrine of the Jews relative to tradition, as Jewish stated in their writers of authority, such as Maimonides, &c., is, that Moses, while he was on the Mount, received both the *written* Law of the *Pentateuch* and also the *oral* Law, or the *proper interpretation* of this written Law, which was subsequently embodied in the *Mishna* and the *Talmud*.* This latter, the body of decisions respecting the interpretation of the written Law, was, according to them, handed down from him

* See the quotation from *Shemoth Rabba* in Eisenmenger's *Entdecktes Judenthum*, vol. i. p. 299, &c.

Theology. orally, till in process of time it became necessary to write it down, lest it should become lost or corrupted.*

As the written Law contains both *precepts* and the *history* of their delivery, so the *Talmud* contains both explanations of the precepts, each explanation being called an *Halacha*, and historical matter connected with them, each narrative being termed an *Agada*.† The extravagant assertions of the Jews with regard to the *Talmud* having been communicated to Moses and orally propagated from his time, need scarcely any argument to expose them. Those who are best acquainted with the *Talmud* know well how contradictory a large portion of it is to the plainest dictates of morality and religion, as found in the *Bible*, and how inconceivably childish, incredible, and foolish is the matter with which it often abounds. But the decisive point against it, is the utter want of any evidence to establish these pretensions.

In the *Pirke Aboth*, sec. 1, the succession from Joshua to Ezra is thus disposed of:—"Moses received the Law from Mount Sinai, and delivered it to Joshua; Joshua delivered it to the elders, the elders to the prophets, and the prophets to the men of the Great Synagogue."

The account given by Maimonides is just as unsatisfactory, and yet this is the sort of evidence for the early existence of this oral Law, on which we are required to believe that all the decisions of the *Talmud*, collected nearly one thousand years after the days of Ezra, were received by Moses from God Himself on Mount Sinai!

The account given by Maimonides (preface to the *Yad Hachazakah*) is this: "Although the oral Law was not written, Moses, our master, taught it all in his council to the 70 elders: Eleazar also, and Phinehas and Joshua, all three received it from Moses. But to Joshua, who was the disciple of Moses, our master, he delivered the oral Law, and gave a charge concerning it. In like manner Joshua taught it by word of mouth all the days of his life; and many elders received it from Joshua, and Eli received it from the elders, and from Phinehas." (Maim. ap. M'Caul, *Old Paths*, p. 177.) No successor is named to Joshua, and no proof of the existence of a *Sanhedrim* for the 200 years between Joshua and Eli can be given. Indeed the *Bible* would shew that there was then no *Sanhedrim*. See Dr. M'Caul's *Observations* in *loc. cit.*

An acquaintance with the views of modern Jews is absolutely requisite to those who enter into the Jewish controversy. A few treatises of the *Talmud* have been translated, but Chiarini's translation of the *Berachoth* is invaluable. Dr. Pinner's *Extracts, translation, and edition of the Talmud*, in Hebrew and German (*Compendium des Hierosolymitanischen und Babylonischen Talmuds*. Berlin, 1832), appears not to have advanced, till the close of last year (1842), beyond the Introduction. Besides the edition of the *Mishna* by Surenhusius, an useful edition of it, with points, and a German translation in Hebrew letters, has lately been published at Berlin. Lightfoot, Schættgen, Eisenmenger, Chiarini, M'Caul, &c., as quoted above, will be found of much service. Dr. Pinner and Jost (the chief editor of the Berlin *Mishna*) are both Jews; the latter is, however, rationalistic in his views. See his *Geschichte des Israelitischen Volks*.

2. On Tradition in the Christian Church.

Romish doctrine. Tradition.

In considering the question of Christian Tradition as an independent Divine authority, the claims of the Church of Rome alone come under examination. It is, therefore, necessary briefly to state the doctrines of that church on this important subject, in the language of her public formularies and her accredited

writers. Among her writers the principal authority is Theology. Cardinal Bellarmine, who has devoted a considerable portion of his controversial works to a treatise *De Verbo Dei*. Of this treatise, the three first books "relate to the written word of God (*verbum Dei scriptum*) as contained in the *Old* and *New Testament*; But the fourth book, which relates wholly to Tradition, is entitled 'Of the *unwritten* word of God' (*de verbo Dei non scripto*), and therefore declares by its very title the quality of that Tradition which is the subject of that book."* Bellarmine there observes, that although the name of Tradition† is a general term implying any doctrine, whether written or unwritten, which is communicated by one to another, yet Theologians properly restrict it to mean only *unwritten* doctrines.‡ He further states, that these are called *unwritten* doctrines, not because they are *nowhere* written, but because they were not written by the authors themselves.

These traditions are divided into three classes, of which we have here to consider only the two first; as the third (*Ecclesiasticæ traditiones*) is confessedly of human origin, and relates to customs, and not to doctrines. The two classes with which we are concerned are called, 1. *Divinæ*, and, 2. *Apostolicæ*, and are thus defined:—

1. *Divinæ [traditiones] dicuntur, quæ acceptæ sunt ab ipso Christo, Apostolos docente, et nusquam in divinis literis inveniuntur.* (Bell. *De Verbo Dei*, iv. 2.)

"*Divine [traditions]* are those which were received from Christ himself, teaching [them to] the Apostles, and are nowhere found in Scripture."

2. *Apostolicæ traditiones propriæ dicuntur illæ, quæ ab Apostolis institutæ sunt, non tamen sine assistentia Spiritus divini Sancti, et nihilominus non extant Scriptæ in eorum epistolis.* (Id. *ibid.*)

"*Apostolical traditions* are properly those which were taught by the Apostles, not, however, without the assistance of the Holy Spirit, and which, notwithstanding, are nowhere written in their Epistles."

Bellarmino (iv. 3.) proceeds to observe, that the doctrine of the Romish Church is, that the necessary doctrine, whether relating to *faith* or *morals*, is not all expressly contained in Scripture, and that besides the *written* word of God, the *unwritten* word, i. e. *divine* and *apostolical* traditions, are necessary; while Protestants contend that all things *necessary* to *faith* and *morals* are contained in the Scriptures. He states, that the total rule of faith is the word of God, or the revelation of God made to the Church, which is divided into two *partial* rules, *Scripture* and *Tradition*.

The Council of Trent, although it does not make use of the words *divine* and *apostolical* traditions, yet distinguishes the two classes of doctrines, as those taught by our Lord's *own mouth* and *by his Apostles*: it states that the whole truth and instruction so taught is to be found in the *written* books, and the *unwritten* traditions derived from Christ's own mouth, or from

* Bishop Marsh's *Comparative View of the Churches of England and Rome*, p. 6, last edition, 1841.

† Tradition is sometimes used for the *vehicle* by which a doctrine is transmitted, sometimes for the '*doctrina tradita*,' or the doctrine so transmitted. It is in the latter sense we are chiefly concerned with it here. Tradition is also used sometimes in the plural, denoting *Apostolical* doctrines, each of which is a tradition; but when used in the singular without the article, it usually denotes the *sum* total of these doctrines.

‡ Bellarmine, *De Verbo Dei*, lib. iv. cap. 2.

* See Maimonides, preface to the *Yad Hachazakah* and to the *Mishna*; the *Pirke Aboth*, sec. 1, with the notes in Leusden and Surenhusius; Chiarini's *Theorie du Judaïsme*, vol. i. p. 1-63; Ditto, *Le Talmud de Babylone traduit*, &c., *Prolegomènes passim*; Dr. M'Caul, the *Old Paths*, No. 45; Lightfoot's Works, *passim*.

† Chiarini's *Theorie du Judaïsme*, p. 62.

Theology. the Apostles, or from the teaching of the Holy Spirit; and it determines that the *Scriptures* and these *traditions* are to be received with equal regard and veneration (*pari pietatis affectu ac reverentia*).—*Concil. Trident. Canones et Decreta. Sess. iv. Decretum de Canonicis Scripturis.*

It will be seen, by the above statement, that *Scripture* and *Tradition* are placed by the Church of Rome upon an equal footing, and rendered independent of each other.* Every article delivered by the one must be equally valuable, equally necessary, with those of the other.

Now this view is entirely opposed by the Church of England, in her Sixth Article, which asserts, that "Holy Scripture containeth *all* things necessary to salvation, so that whatsoever is not read *therein*, or may be proved *thereby*, is not to be required of any man that it should be believed as an article of faith, or be thought requisite or necessary to salvation."

The rule of the Romish Church is therefore rejected by the Church of England; and on an examination of their respective doctrines, it will be seen that the doctrines received by Romanists on the sole evidence of tradition are rejected by the Church of England.

This is a brief statement of the principal questions at issue respecting tradition. It now only remains to inquire, as briefly as possible, on what grounds we may justly form an opinion on this point.

Bossuet, in the 18th chapter of his *Exposition de la Doctrine de l'Eglise Catholique*, says that Jesus Christ, having founded his church on preaching, the unwritten word was the *first* rule of Christianity; and when the writings of the *New Testament* were added to it, its authority was not forfeited on that account; which makes us receive with equal veneration all that has been taught by the Apostles, whether by writing or by word of mouth, which St. Paul expressly recommends to the Thessalonians. (2 *Thess.* ii. 14.) The fallacy in this argument is quite apparent; it lies in the word *added*, which is a *petitio principii*, for the very term implies such a difference between the things themselves as tacitly affords a foundation for the future† superstructure of the Romanists. It artfully implies that at least a *part* of the word of God, as delivered by Christ and his Apostles, was *not* recorded in the *New Testament*, a point which the Romanists cannot fairly take for granted, when arguing with those who deny it. With regard to the passage from St. Paul, it seems rather to refer to directions given to the Thessalonians as to conduct than to doctrines; and even if it referred to doctrines, cannot prove the point required, unless it can be shewn that these doctrines are not *now* a part of the written word of God, either in the Apostolical Epistles or the Gospels, as a part of the teaching of our Lord.‡

* According to the Romish view, the chief depository of traditions are the works of the Fathers, from which, however, the *doctrina tradita* is supposed to be transferred to the decrees of general councils; but still, as no such council was held till the IVth Century, the works of the Fathers must still be regarded as the *primary* repository.

† See Bishop Marsh's *Comp. View*, &c., p. 69.

‡ See Irenæus, who in speaking of the Apostles, (iii. 1.) says, *per quos Evangelium pervenit ad nos, quod quidem tunc præconaverunt postea vero per Dei voluntatem in Scripturis nobis tradiderunt, fundamentum et columnam fidei nostræ futurum.* The above passage of Irenæus ought to be remembered well by all who enter into this question.

Theology. The argument of the Romanists fails in the very first step, that of proving the *mere existence* of any such traditions; but if we examine it further, we shall find every succeeding step liable to some fatal objection or resting on some feeble argument. If there were any such traditions as these, how are we to *know* them,* and separate them, as found in the works of the fathers, from the less authoritative matter by which they are surrounded? When the Romanists appeal to the Fathers as speaking of traditions which came from the Apostles, the argument proves valueless, when we remember that under that word were understood the doctrines *written* in the Scriptures, or *customs* derived from the Apostles; and therefore such passages would give no sanction to the views propounded by the Church of Rome. The last weak argument we shall notice is that of Bossuet, who observes, "a most certain mark that a doctrine comes from the Apostles is, when all Christian churches embrace it, without its being in the power of any one to shew were it had a beginning." (Comp. Bell. *De Verbo Dei*, iv. 9.) It is ingenious to convert the *uncertainty* of the origin of a doctrine† (or our ignorance of *where* it had a beginning) into a *certain* mark that it comes from the Apostles; but it would seem to most rational minds a better argument to say, that of the doctrines recorded in the *New Testament* we *do know* the origin, and this very knowledge is an imperative reason for our receiving them. And it is a sufficient reason to establish at once a difference between those doctrines and mere traditional ones, which the Romish Church places on exactly the same level.

The question of *Tradition* is discussed in every controversy between the Anglican and the Romish Church. But, in general, in the older writers, two other questions are so mixed up with it, that they can hardly be separated, the *doctrine of Fundamentals* and the *final Resolution of Faith*. The Church of Rome holds all points defined by the Church to be fundamental. The Protestants give no catalogue of *Fundamentals*. Archbishop Laud said, that "all the points of the Creed were fundamental." (Laud's *Conference with Fisher*, § 2.) See also White's *Conference with Fisher*, § 2, 5, and 6. See also Stillingfleet's *Grounds of the Protestant Religion*. Mr. Palmer's *Treatise on the Church*, vol. i. p. 122, has some very useful observations on the *Doctrine of Fundamentals*, in which he objects to the use of the word.

On Tradition and Scripture, the treatise of Whittaker, *De Sacra Scriptura*, ought by all means to be consulted, as well as Bishop Marsh's *Comparative View*, &c. The *Downside Discussion* is also useful, although some of the Protestant statements about the Church, &c. are unsound. Stillingfleet's *Tradition and Scripture compared*, and his *Council of Trent disproved by Tradition*, are very valuable. Archbishop Tillotson's book, *On the Rule of Faith*, is a sufficient answer to the weak book against which it was written, but does not give a general view of the whole question.

3. Inward Light and Special Revelations.

There is yet one other source of knowledge which men have invented beyond the word of God; that is to say, false and pretended revelations. In many ages

* The particular Romish Church setting herself in the place of the whole Catholic Church, makes her acceptance of them a sufficient proof that they are traditions of the whole church from the first times.

† It would, indeed, be a strong argument in favour of any doctrine, to shew that it had been universally received at all times; but we may confidently ask which of the doctrines received by the Church of Rome, and rejected by the Church of England, such as *Transubstantiation*, the *Worshipping of the Host*, the *Propitiatory Sacrifice of the Mass*, the *Invocation of Saints*, the *Communion under one kind*, &c., can be supported by any such evidence from the first four centuries?

Theology.
Internal
light.
Special re-
velations.

of the Church these have existed, but have usually died away after a short season. Some of the most remarkable have been those of the IInd Century, viz., the heresy of Montanus. Of this a sufficient account is given in another portion of this work, Hist. Div. iii., 150.* Subsequently, Ecclesiastical History gives us several instances of similar claims to prophecy and divine illumination, as for instance, Munzer and Stork in Germany, just at the rise of the Reformation, and subsequently Kotter, Poniatowsky and Drabicius, whose prophecies are found collected in a volume called *Lux e Tenebris*, published in 1665,—these prophets having uttered prophecies which were altogether falsified by the events, e. g. the success and glorious subsequent career of Gustavus Adolphus just before the battle of Lutzen, in which he perished.† Again, about the beginning of the last Century occurred the case of the French prophets, of which some account will be found elsewhere. (Hist. Div. vol. v. p. 1139.) Their views were revived, and some of their publications were reprinted, by Mr. Irving, a few years ago. In the preface to his reprint of *The General Delusion of Christians* (an answer to *The Spirit of Enthusiasm Exorcised* of Dr. Hickes), Mr. Irving maintains that the predictions of these prophets were partly given by God's spirit, but were affected and imitated in other cases by the devices of Satan; and this so effectually that it is impossible now to separate the gold from the dross, or scarcely to recognise any of the precious metal. It will hardly be necessary to do more than to mention these unhappy attempts to claim those gifts of the spirit which are miraculous, instead of endeavouring to profit by the influence of the Holy Spirit of God upon the heart of man, in leading it to holy thoughts and righteous conduct. For another form under which this delusion has affected man, we must refer to our Miscellaneous Division, under SWEDENBORG.

There is one more circumstance which claims our notice, and that is the necessity of an Inward Revelation, as maintained by Barclay in his *Apology for the Quakers*. (Prop. i.—iii.) It is unnecessary to do more than to refer the reader to this portion of the author, who is acknowledged to give us such a system as Quakers profess to abide by (Wotton's *Thoughts on the Study of Divinity*, p. 50); for it seems to us that a treatise which gives only the second place to Scripture (Barclay, Prop. iii. sec. v.), proved to come from God by prophecies and miracles, and sets above it the inward light which a man believes to come from God, cannot produce much effect on any person acquainted with the word of God. Nor does there seem to us anything in his three propositions but very illogical reasoning and very erroneous conclusions. To those, however, who wish for an answer to this treatise, we may mention the *Confutation of Quakerism*, by T. Bennet, D.D. London, 1733, third edition.

No serious and religious mind can for a moment doubt the necessity of the guidance of God's Spirit to man, to lead him to all things profitable to his salvation; but this influence is a moving influence on his will, and not an immediate revelation to his intellect. That God,

Theology.
as we continue to do His will by this influence more perfectly, will vouchsafe to us a further knowledge of His doctrine, follows from our Lord's own words, and forms the hope of every devout Christian. As he becomes more influenced by that Spirit, his views of God's dealings with man, we cannot doubt, will be clearer and more satisfactory, and the Scriptures will bring greater knowledge of these to his mind, and further comfort to his heart; but we know of no principle either of reason or Scripture which will admit of our placing any such influences in the light of inward revelations, or allow them to supersede the appointed human means of obtaining a knowledge of Divine things.

This is, we must remark, only one of the common forms which mysticism assumes. When a man is persuaded that he has immediate revelations from God, and can yet produce no evidence but that internal impression (which it is clear can be no evidence whatever to another man's mind), it is of course nearly useless to reason with him. We can only point out to him that he gives no evidence of the fact which is trustworthy to another, and point out the difference between his case and that of Scripture revelation. When we have full evidence that God has interposed miraculously to instruct the world in the case of certain individuals, we do not require external evidence in every special case: they are proved already to be living under a different condition, and in a state of immediate communication with God, and that is sufficient; but the proof that they are so is in the first instance external. Scripture gives no instances of an internal call from God with special revelation, unaccompanied by external proofs.

Of the Rule of Faith.

Having stated the Roman Catholic doctrine of Tradition, and shewn that it is unwarranted by any principle which can be judged trustworthy, we now proceed very briefly to consider what is usually called "The Rule of Faith." We must, however, premise that this is a term which we should prefer to see entirely disused. The principle for which we contend is, that the Inspired Scriptures are sufficient for salvation; so that those things which are not read therein, nor can be proved by them, are not to be required to be believed as necessary to salvation. We can allow no place to any unwritten tradition to stand beside this depository of God's word, and challenge our belief to any matters of faith not contained in that book, or proved by it, with equal claim and independent authority. This, it will have been seen by the preceding section, is the claim set up by the Church of Rome for unwritten tradition. Nothing short of this claim satisfies either the language of the Council of Trent or the authorized writers of that church. We are not aware that the authorized formularies of either church have defined this expression. It has, however, been used by controversialists on both sides; and the usual statement has been, that Scripture and Tradition is the "Rule of Faith" to the Church of Rome; Scripture the "Rule of Faith" to the Church of England. This is the position very commonly assumed by the writers on this controversy. We conceive that this statement is unnecessary on either side, after the explicit statements of the 6th, 7th, and 8th Articles of the Church of England, and the equally explicit declarations of the Church of Rome in the Fourth Session of the Council of Trent, and the Creed of Pius IV. We think the controversy between the two churches is uselessly encumbered by the use of this term, and that it only serves to engender greater strife, and makes it less easy to discern clearly the principles by which both are guided. But on the other hand the Church of England is ready to shew that she

* In addition to the sources of information there quoted, we may refer also to Neander, *Allgem. Geschichte der Christl. Kirche*, vol. i. sec. v. (In the translation, vol. ii. p. 165-195.)

† For a good account of these German prophets, see *The Modern Claims to the Possession of the Extraordinary Gifts of the Spirit, Stated and Examined, &c.*, by the Rev. W. Goode, 1833.

Theology. has rejected nothing in her articles which has any real claim to universality and primitive antiquity, and at the same time to shew that those points for which the Church of Rome appeals to tradition, even if legitimately tried by that test, have no real claim to our acceptance.* The words "Rule of Faith" (*regula fidei*) are found in Tertullian (*De Virg. Vel.* p. 173, ed. Rigalt: compare *Adv. Praxeam*, p. 501), and there applied to the Creed. Irenæus uses the words *veritatis regula*, but we believe that the phrase *regula fidei* first occurs in Tertullian. We are aware that Irenæus appeals to tradition; but, on the other hand, when we examine the articles of faith for which he makes this appeal—an appeal, be it remembered, in answer to an appeal to tradition also on the part of the heretics—we find that it is for those very propositions which are found in the Creed.† But as tradition has been as fully considered as our limits allow, in a preceding section, we need not repeat these arguments. We have already observed that we prefer not to use the words "Rule of Faith;" but while we do this, we cannot allow that the *Bible*, interpreted according to the private judgment of individuals, is a sufficient *test of doctrine*, or the test by which the Church of England meant to abide in setting forth the great doctrines of the Scripture as taught in the Church. The Church of England, in its Articles, expressly declares the three Creeds to be certain, as being able to be demonstrably proved from Scripture; and the greatest writers of that church have not scrupled to acknowledge that the *universal testimony* of the Primitive Church to the doctrines of Scripture is a guide not to be departed from in ascertaining the doctrines of our faith; but in so doing they utterly repudiate the *particular* tradition of the Church of Rome.

We have, then, in conclusion, to state the following general results:—

1. That the Scripture containeth all things necessary to salvation.
2. That the Creeds, though not drawn originally from the Scriptures, contain a doctrine identical with that of Scripture, may be proved from Scripture, and cannot be gainsaid.
3. That the Church of England rejects no doctrine attested by the universal consent of the Catholic Church for the first four centuries.

* See Stillingfleet's *Tradition and Scripture compared*; his *Council of Trent disproved by Catholic Tradition*; Whitaker's *De Sacra Scriptura*; Bishop Marsh's *Comparative View*.

† Irenæus, *Contra Hæreses*, lib. iii. in initio, cap. i.-iii. Massuet, in his *Dissertation* on this subject, makes a great handle of this passage against Grabe, whose notes, however, he does not venture to quote.

4. That she allows no other independent source of Divine authority, and that the articles on which she differs from the Church of Rome can be shewn to be late introductions into the Church, and many of them absolutely opposed to primitive tradition and to Scripture.

For the use which individuals are to make of Scripture, we need not enter into much detail. That the fullest and most free use of the Holy Scriptures ought not only to be allowed, but recommended and enjoined by the Church, we cannot hesitate to affirm; but not in order to draw from them a system of doctrine. We believe that no discoveries of great religious truths remain to be made; we believe that the early Christian Church was in possession of the great fundamental points of doctrine, and that he is in the safest and most healthy condition of mind who, submitting his private judgment on these points to the universal Church of Christ, reads the Scripture in the spirit of prayer, chiefly for the edification of his soul and for instruction in righteousness; to attain a further acquaintance with the infinite goodness and mercy of God; to attain to a purer love of God's holy truth, and a deeper gratitude for His overwhelming love; to attain to a more humbling conviction of sin, a more penitent heart, a more ready acquiescence in God's will, and a more perfect obedience to His law. He that desires thus to know God, as revealed to us in Scripture as the Father who created, the Son who redeemed, and the Holy Ghost who sanctifies us; he who desires from his perusal of Scripture to rise with a more enlightened faith in Jesus Christ, and a brighter charity to man, we believe turns Scripture to its chief purposes as destined for individuals, and he will find it a lamp to his feet and a comfort to his heart!

Archdeacon Manning, in his Visitation Sermon entitled *The Rule of Faith*, has treated many of these points well. He maintains that the "Rule of Faith" is the *test of doctrine*, the rule by which we may ascertain what are the doctrines of the Gospel; and he thus briefly expresses what he considers the "Rule of Faith" of the English Church: "Scripture and Antiquity, or Scripture and the Creed attested by Universal Tradition." And he shews by quotations that such a rule is recognised by the great writers of the Primitive Church and the Church of England. We have contended against the phrase; but in the practical application of such a rule we have certainly a perfect reliance that it would establish nothing rejected by our church, nor impugn anything which it maintains. And there is good reason for this. One principle by which the reformers were guided, was deference to the universal consent of antiquity in extracting doctrines from Scripture. This is a different thing from the *interpretation* of particular passages of Scripture. The latter is the province of *Hermeneutic* and *Exegetical* Divinity. To this work, and the others mentioned in preceding sections, we must refer those who wish to enter further into this question.

APPENDIX TO CHAPTER II.

On the Argument from Prophecy.

Theology. It may, perhaps, be desirable to sketch out the course which the argument from prophecy here brought forward takes, and to point out the only difficulty to which it seems liable.

It is first pointed out that the *Bible* is the most ancient historical record existing; that several portions of it claim to be prophetic; and that when we apply the test of history to many of the predictions contained in it, the truth of this claim is wonderfully confirmed by the agreement of these predictions with subsequent experience and history.

These are mere preliminary steps to a consideration of the grand argument arising from the fulfilment of the prophecies of the *Old Testament* by the events recorded in the *New*, and by the results consequent on the preaching of the Gospel. They are merely meant to challenge our attention to the *Bible* as being *prima facie* distinguished from all other books.

The prophecies of the *Old Testament* are then examined which relate to the promise given to man in the person of his first parents, and continued from time to time throughout the age to which the *Bible* belongs.

These prophecies may be divided into perfect and imperfect. (See Archdeacon Lyall's *Propædia Prophetica*.)

1. The *perfect* prophecies are those which were understood and acknowledged to be prophecies of the events of the Messianic age.

2. The *imperfect* prophecies are those the meaning of which was not ascertained and acknowledged till after the events had taken place in which their fulfilment is traced. Such are many of those which relate to minute points in our Saviour's history, which are yet far too numerous and remarkable to admit of any explanation but that which supposes them Divine predictions. (See above.)

Archdeacon Lyall, in the valuable work to which we have so often referred, has treated this question with great clearness and force. He argues that the prophecies were intended to educate the Jewish people (to be a *propædia* to them) as to a future revelation, and enable them to recognise it when it pleased God to give it; and that, as we might expect from these circumstances, the main object of the Apostles, in most of their arguments, is to prove that Jesus was the Messiah whom the Jews had been taught to expect. He has given the opinions of the oldest Jewish writers of authority (as we have before stated), and he believes that they represent, from traditional sources, opinions which we may consider contemporary with, and previous to, the times of the Apostles.

The question is one of great importance, and it requires great judgment and discrimination to discuss it properly. Professor Lee, it will have been seen, takes an entirely different ground, and denies that these opinions can be traced to so early a period. This would, of course, give a complete answer to Bertholdt; but

the question still arises, which view is founded in *Theology*. truth? and we must not adopt this opinion merely because it affords a ready answer to a neological—we might almost say an infidel—work, which, after all, is of no great weight or importance. The collections of Bertholdt are useful; his reasoning upon them of little value; and we think the considerations offered in our note upon the subject (p. 869), if pursued legitimately, would furnish an overwhelming argument against him. We may be fully assured, that whatever the Almighty has done in the matter of evidence, will be liable to no real objections, although our ignorance may occasionally raise up apparent difficulties.

Commending, therefore, the whole subject to the strict investigation of the learned, we shall close these remarks by adducing the summary given by Archdeacon Lyall, which is almost indispensable to the complete development of our argument.

Extract from Archdeacon Lyall.

"In order to keep the proofs which I shall bring forward within a reasonable compass, I shall confine them to a fixed part of the Old Testament. By far the largest number of the passages alleged by the writers of the New Testament are found in two books, viz. Isaiah and the Psalms. Let us then take these, and examine, one by one, every passage quoted from them by the Apostles, as applicable to Christ. Next let us turn to the two works just mentioned, to see whether the same passages were referred by the ancient synagogue to the Messiah. Whenever this shall appear to have been the case, it will be evident that the sense put upon them by the Apostles was not of their own 'private interpretation,' but was that which the nation at large had been instructed to receive.

"Ps. ii. 1, 2, 6, 8, quoted Acts iv. 25, 28; xiii. 33. Referred to the Messiah in Melchita, fol. 3, 3. Sohar. Gen. Midrash. Tehillim.

"Ps. viii. 4, 6, quoted Heb. ii. 6, 9. Referred to the Messiah in Tikkune Sohar. c. 70.

"Ps. xvi. 8, 11, quoted Acts ii. 25, 32. Referred to the Messiah in Bereschith Rabba, sec. 88.

"Ps. xxii. 1, 8, 16, 18, quoted Matt. xxvii. 46. Referred to the Messiah in Midrash Tehillim. Pesikta Rabbathi in Talkut Simeoni, fol. 56, 4. Sohar. Numer. fol. 100.

"Ps. xl. 6, 8, quoted Heb. x. 5, 10. Referred to the Messiah in Midrash. Ruth, fol. 43, 3, 4.

"Ps. xlv. 1, 7, quoted Heb. i. 8, 9; Rom. ix. 5. Referred to the Messiah in Targum. Sohar.; and also by the modern Jewish commentators.

"Ps. lxviii. 18, 19, quoted Ephes. iv. 8. Referred to the Messiah by R. Obadja Haggaon, cited by Cartwright. Schemoth Rabba, sec. 35.

"Ps. lxix. 21, quoted Matt. xxvii. 34, 48.—Gall and vinegar given to Christ to drink. I have found no Jewish authority for the application of this particular fact to the Messiah, either in Schoettgenius or the *Pugio Fidei*; but the Psalm itself is applied to him generally by several writers quoted by Martini.

"Ps. cx. 1, 4, quoted Heb. v. 5, 6; vi. 19, 20. Compare Sohar. Gen. fol. 35; Sohar. Num. fol. 99; Midrash. Tehillim ad loc. Targum. Sohar. Chadash, fol. 42; Gen. fol. 42, 29.

"Ps. cxviii. 22, 23. Compare Sohar. Gen. fol. 118; Idem Numer. fol. 86, *et passim*.

"The above are the only Psalms to which I can find any plain allusion in the New Testament; and if we may trust to the references given by Schoettgen and Raymundus Martini, they are all of them, either generally or particularly, applied to the times of the Messiah by the old Rabbinical writers. We are not, however, to suppose that those here quoted are the only Psalms which

Theology. the ancient Jewish Church so explained. On the contrary, many not adduced in the New Testament might be added. The principle of interpretation adopted by the Jews would appear to have been very simple. It was, that whenever any expressions were found in the prophetic writings conveying a meaning too high and comprehensive to admit of an historical application to known persons or events, such expressions should be referred either to the Messiah himself or to his promised kingdom. As to double senses of the prophecies, of which Grotius and Warburton talk, and other writers after them, it may be doubted whether such a notion ever entered into the minds of the ancient Jews. Their rule seems to have been founded on the opposite supposition, that no prophecy could have two senses; and, therefore, that when the literal sense of the inspired writer afforded no intelligible meaning, the words were to be understood prophetically. In fact, if it be once allowed that a prophecy is capable of more than one true interpretation, where are we to fix the limit? The danger of such a principle needs not to be pointed out; and except it be founded on stronger reasons than are given by Grotius in his Commentary on St. Matthew, chap. i., it is as unfounded as it is dangerous. But to return to our subject.

Of the sixty-six chapters which compose the Book of Isaiah, all, except fifteen, are referred, by one Jewish writer or another, to the times of the Messiah; but in the New Testament, I think that there are not quotations from more than sixteen or seventeen.

"Is. ii. 1. 5. Conversion of the Gentiles. John x. 16; Acts xxviii. 28. These passages are applied to the Messiah in the Targum, and generally by Jewish commentators, both ancient and recent.

"Is. vii. 14. The miraculous birth of Christ. '*Hoc caput*,' says Schoettgen, '*Judæi antiquiores, ex inscitâ, juniores vero, ex malitiâ neglexerunt.*' I shall take occasion, in my next lecture, to offer some remarks upon this important prophecy, which will, I hope, both explain the ignorance of the ancient Jews, and vindicate the present from the charge here preferred by Schoettgen: but in the meantime it is sufficient to say that this prophecy stands out almost singly, as one which the Apostles have applied to Christ on their own authority.

"Is. viii. 13, 14. Christ a stone of stumbling. Rom. ix. 33; 1 Peter ii. 7, 8. Applied to the Messiah in Sanhedrim, fol. 38. Breschith Rabba, sec. 42, fol. 40.

"Is. ix. 'Unto us a child is born.' This very important

Theology. prophecy is referred to the Messiah in the Targum, and it is generally so understood by Christians. Nevertheless, I cannot satisfy myself that any allusion to it is to be found in the New Testament.

"Is. xviii. 16. Christ the chief corner stone. 1 Pet. ii. 3, 6. Applied to the Messiah in Sanhedrim, fol. 98, 1. Talkut Simeoni, i. fol. 49, 3. Breschith Kezara, citante Raymundo Martini in *Pug. Fid.* ii. 4, p. 313.

"Is. xxx. 3, 4, 15. Miracles of the Gospel, and effusion of the Spirit. Acts ii. 4; Rom. xi. 18. Compare Janchuma, fol. 1, 2; Debarim Rabba, sec. 6, fol. 258, 2; Sohar, Chadash, fol. 89, 3.

"Is. xxxi. Times of the Messiah. New Testament *passim*. See Pesikta Rabbathi, fol. 29, 3. Tanchuma, Talkut Simeoni, i. fol. 157, 1. Sohar. Exod. fol. 34, col. 134.

"Is. xl. John the forerunner of Christ. This chapter is referred to the Messiah by the present Jews as well as by the ancient. See Kimchi; Aben Esra; Pesikta in Talkut Simeoni, ii. fol. 49, 1, as quoted by Schoettgenius *in loco*.

"Is. xlii. 1, 7, 16. New Testament *passim*. Applied to Christ in the Targum, and by all the present Jews.

"Is. liii. The whole chapter is referred to the Messiah in the New Testament, as it is also in the Targum, and in the Sohar *passim*.

"Is. lv. 1, 5. Christ the living water. John iv. 10, 14. Schoettgen quotes from Galatinus, Breschith Rabba ad Genes. xlix. 14; but the passage is not found, he tells us, in the editions which he has consulted.

"Is. lx. Glory of Christ's kingdom. New Testament *passim*. So applied in the Targum, and by the ancient Jewish Church, *passim*.

"Is. lxi. Christ anointed by the Spirit. Luke iv. 16; Matt. iii. 16, 17. This chapter is referred to the Messiah by the modern Jewish commentators as well as the ancient.

"If it would not be tedious, it would be a task of no difficulty to go through the remaining passages quoted from the Old Testament by the Apostles, in confirmation of Christ's divine commission. They are, I believe, not more than between twenty and thirty; and with the single exception of Job xix. 25 (about which the Jews both of the present and of former times are silent), in every instance the authority of the ancient synagogue may be produced in confirmation of the interpretation the Apostles affixed."—*Propædia Prophetica*, p. 101—106.

OUTLINES OF THEOLOGY.

CHAPTER III.—SCRIPTURE DOCTRINES.

The Doctrine of Holy Scripture, (1) respecting God, and (2) respecting Man.

Theology. (1.) ALTHOUGH, as we have seen, the indications of a God are so many "in the things which are made," that all must be regarded as "without excuse" who do not recognise there the "power and Godhead" of the Supreme Lord, yet the idea of what God is, can only be communicated by God himself. On this subject, of all others, we require the teaching of Divine revelation. The Psalmist, therefore, after asserting that the heavens declare the glory of God, and the firmament His handy-work, and that the regular successions of day and night proclaim continually the knowledge of the Most High, refers at length to the revelation of God's law as the source from whence, after all, the most perfect instruction respecting the Deity will have to be collected.*

We may not, however, suppose that revelation is intended to make us so familiar with the nature and attributes of God, as that we should, by searching it, "find out God to perfection." He who dwells in the light that is inaccessible to the mortal gaze, must, in the nature of things, be so far exalted above the region of man's finite apprehension, that in our most advanced stage of information respecting God, we shall have to admit that "such knowledge is too wonderful and excellent" to be attained by us; and that even with the assistance of revelation we shall be conscious that, as yet, "we see through a glass darkly." Nevertheless, so far as God has been pleased to reveal himself in His word, we not only may, but ought, reverently to study what revelation teaches respecting the Divine attributes and perfections, that by this means we may catch some rays of the ineffable majesty and glory of Him "whom to know is everlasting life."

(2.) On opening the *Bible*, then, we find that we are no longer left to collect the *unity* of God from probable inference, for we perceive that cardinal verity to be proclaimed from one end of the *Old Testament* to the other. There is no truth, in fact, which God's ancient people were more strictly charged to remember, than that "the Lord is God in heaven above and in the earth beneath; there is none else:" that "the Lord our God is one Lord."† Therefore, we find an acknowledgment of this prime article of revelation in almost all the recorded addresses to God that believers of old uttered:‡ whilst the Almighty calls His chosen nation to bear witness that "before Him there was no God formed; that besides Him there is no God."§ The same important doctrine pervades the *New Testament* Scriptures also. Our Lord himself, for instance,

represents the unity of God to be the first and great Theology. commandment.* Then the Apostle of the Gentiles, in speaking of the conversion of the Thessalonians to the Christian faith, represents that important event as a turning "to God from idols, to serve the living and true God:"† and in accordance, therefore, with this sentiment, he asserts on other occasions that there is to Christians "but one God, the Father, of whom are all things: the one Lawgiver who is able to save and to destroy; the blessed and only Potentate; the King of kings, and Lord of lords."‡

(3.) Yet this one Lord is not a Being that can be represented to the bodily senses. Nothing, indeed, can be more striking than the contrast between the idea of God which, in this respect, Revelation inculcates, and that notion of Deity which originates in the inventions of the human mind. Whilst those attempts to exhibit the "King, immortal, invisible," by sensible images, which mark the history of superstition in every age, shew how low and unworthy are the conceptions of the Divine Nature that man can entertain, the Scripture representations of God are, that He "is a Spirit," whom no man hath seen, or can see; who can be likened to nothing, and compared to no likeness; and that, therefore, it is as useless as it is sinful to picture the great God by the image of anything that is "in heaven above, or in the earth beneath, or in the water under the earth."§ Although, therefore, the Scriptures may sometimes speak of the 'face,' the 'eye,' or the 'arm' of the Lord, as if the Deity were possessed of the different members of the human body; yet the incorporeity of God is so plainly assumed throughout the *Bible*, that representations of this nature cannot be understood in any literal acceptance of the terms used. But as we ourselves are frequently obliged to refer to sensible objects in order more clearly to express our conceptions of spiritual things, so the Almighty, in condescension to our limited faculties, has been pleased to speak of Himself by references to things with which we are familiar, that thus we might be led more vividly to apprehend, not the form and essence of His invisible nature, but the real existence of the Divine attributes and perfections as manifested in visible operation.|| The same observation applies also to

* *Psalm* xix.; See also *Psalm* xxix. xcii.

‡ *1 Cor.* viii. 4, 6; *1 Tim.* ii. 5.

§ *John* iv. 24; *Exod.* xx. 4; *Isaiah*, xl. 18.

|| Tertullian (*Adv. Praxeas*, cap. vii.) makes use of an expression ("quis negabit Deum corpus esse, &c.") which has caused him to be charged with maintaining the corporeity of the Deity. It is probable, however, that by *corpus* he meant substance generally, as expressive of individuality and real existence, and as opposed to *inanimatus*. We are still inclined to suggest this explanation, although St. Augustine seems hardly willing to give him the benefit of it. (*Aug. Ep.* 157.) There were others, also,

Theology. such portions of Scripture as represent the Deity as being actuated by love or pity, anger or jealousy, or other human affections,—these various terms being employed to convey to us some idea of those various workings of Divine providence and grace which are observable in the universe.

(4.) The God who is thus purely spiritual, “without body, parts, and passions,”* is also the king “eternal,” “the number of whose years cannot be searched out. He is the first and the last; whose existence was before the world began, and who continueth and liveth for ever: for before the mountains were brought forth, or even the earth and the world were made, He is God from everlasting and world without end. He only hath immortality: He was, and is, and is to come.”†

(5.) In intimate connexion with this doctrine, the *Bible* declares to us the *immutability* of God. With Him “one day is as a thousand years, and a thousand years as one day. His counsel standeth fast for ever, and the thoughts of his heart to all generations. With Him is no variableness, neither shadow of turning. The heavens and the earth shall perish, but He endureth: they all shall wax old as doth a garment, and as a vesture shall they be changed; but He is the same, and His years shall have no end.”‡

(6.) The Scriptures, therefore, as might be expected, display to us the Divine *power* and majesty in a much more striking light than those attributes are reflected even in the works of creation. We may be at no loss to conclude, from what nature reveals, that the power of God surpasses all that we can conceive of; but still all that creation teaches falls far short of such declarations of that Divine attribute as the *Bible* contains. We there learn that “by the word of the Lord were the heavens made; and all the host of them by the breath of His mouth: that He spake and it was done; He commanded and it stood fast. He alone spreadeth out the heavens and treadeth on the waves of the sea: He maketh Arcturus, Orion, and Pleiades, and the chambers of the south. He stretcheth out the north over the empty place, and hangeth the earth upon nothing. He gathereth the waters of the sea together as an heap: He layeth up the deep in store-houses: He measureth the waters in the hollow of His hand, and meteth out the heavens with the span; and comprehendeth the dust of the earth in a measure, and weigheth the mountains in scales, and the hills in a balance. Behold he taketh up the isles as a very little thing—all nations before Him are as nothing. He doeth according to his will in the army of heaven, and among the inhabitants of the earth; and none can stay His hand, or say unto Him, what doest Thou?”§

(7.) So, again, that *wisdom* which is manifested in the adaptation of every thing to its proper place in the universe, and which implies, also, a perfect knowledge, on the part of the Deity, of all things that are the subjects of creation, is represented in Scripture as

Theology. extending without limit of time, place, or circumstance. We are told, that “known unto God are all His works, from the beginning of the world: that He declareth the end from the beginning, and from ancient times the things that are not yet done.” We are assured that the “eye of the Lord is in every place; that He looketh unto the ends of the earth, and seeth under the whole heaven: neither is there any creature that is not manifest in his sight: that He filleth all in all.”*

(8.) We feel, moreover, to be surrounded by an *ever-present* God, when we read, “O Lord thou hast searched me, and known me; Thou knowest my down-sitting and my up-rising; Thou understandest my thoughts afar off. There is not a word in my tongue, but lo! Thou, O Lord, knowest it altogether. If I ascend up into heaven, Thou art there; if I make my bed in hell, behold, Thou art there. If I dwell in the uttermost parts of the sea, even there shall Thy hand lead me, and Thy right hand shall hold me. If I say, surely the darkness shall cover me; even the night shall be light about me. Yea, the darkness hideth not from Thee, but the night shineth as the day: the darkness and light are both alike to Thee. None can hide himself in secret places that the Lord Jehovah cannot see him. Wherever we may be, God is not far from every one of us:” to Him “all hearts be open, all desires known, and from Him no secrets are hid.”†

(9.) And if amid the apparent inequalities of this life, and the conflict of good and evil, natural religion can spell out with difficulty that the maker of all is *good* unto all; the sure word of God teaches that “the Lord is loving to every man, and that his tender mercies are over all His works; that the earth is full of His goodness: that He opens His hand and satisfieth the desire of every living thing:” nay, that “God is love.” Therefore, when the Most High condescended to make himself most familiarly known to Moses, it was as “the Lord God, merciful and gracious, long-suffering and abundant in goodness:—as keeping mercy for thousands.”‡ And that the Divine goodness may be more effectually brought home to the mind, the Scriptures repeatedly direct attention to those manifestations of benevolence in all that God does, and hath done, to bring mankind to happiness and salvation; and to the fact that “he causes his rain to descend on the bad as well as on the good; on the unjust equally with the just; and is continually doing good to the unthankful and the evil.”§

(10.) Yet is this benevolent God himself removed from all possible sympathy with evil: for we find ourselves called upon by Revelation to reverence “the Lord our God as *holy*: righteous in all His ways, and holy in all his works:” nay, “glorious in holiness.” That, as possessed of all moral perfection, He consequently is a God who can have no complacency in wickedness, and with whom no evil can dwell: that He regards all workers of iniquity with displeasure, and that “the sacrifice, the way, the thoughts of the wicked, are an abomination unto Him.”||

of the early Christian writers who, in their controversies with those Heretics that denied the doctrines of the Trinity and Incarnation, sometimes used terms respecting the mode of the Divine existence which are liable to misinterpretation.

Theology.

(11.) For inseparably connected with the revelation of the Divine holiness is the awful attribute of the Divine justice. The Deity is declared to be a "just God;" righteous in all his ways. The Lord Jehovah is thus presented to our faith as prescribing most righteous laws; as administering those laws with the most perfect impartiality; as manifesting, in His providential control of the world, His approbation of good and His displeasure against evil; whilst yet we are taught to expect the full development of the workings of this awe-inspiring attribute only in a future life. The Bible thus clears up those difficulties which otherwise arise out of the apparent affliction of the righteous and prosperity of the wicked, because we are assured, however much appearances may be to the contrary, that the "Judge of all the earth" does "right;"* for that the very habitation of His throne is justice: that hence, as no one good thing which He has promised can fail to come to pass, so not one punishment which He has threatened against the evil-doer will remain uninflicted.

1. Our object being, as we have before observed, to treat this subject practically, we have here touched only upon some of the Divine attributes; and that in the order which appeared best adapted to connect what we had to say with what precedes under the head of Natural Religion. It may, however, not be out of place to mention some of those divisions under which different theologians have arranged the Divine attributes.

a. Some, for instance, divide the attributes of the Deity into *positive* and *negative*. Under the former division are included those attributes an analogy for which we can find (of course in a vastly inferior degree) in ourselves, such as wisdom, benevolence, &c. By *negative* attributes are understood those which imply the absence of all imperfection, such as infinity, omnipresence, &c.

b. Other divines, again, regard the attributes of Deity as being either *active*, *i. e.* those which in any way imply action or operation, such as omnipotence, &c.; or *passive*, those, namely, which imply inaction or repose, such as eternity, &c.

It is manifest, however, that this division of the attributes of God is in the main identical with that which has just been mentioned; whilst the terminology employed is open to objection, since this idea of rest can scarcely be considered as applicable to the God of the Bible.

c. The Divine attributes have further been distinguished by the terms *moral* and *physical*, or *natural*; by *moral* being meant such perfection of the Deity as admit (in some feeble degree) of imitation, such as goodness, holiness, &c.; whilst by the term *physical* or *natural* are to be understood those attributes which find no resemblance in anything created, such as omnipotence, independence, &c.

These perfections have, therefore, been again distinguished, one as being *communicable*, the other as *incommunicable*; as *imitable* and *inimitable*.

In this third division of the Divine attributes it is that theologians now generally acquiesce, as being the least liable to objection.

See Wilkins on *Natural Religion*; Limborg, lib. ii. c. 2; Turretin, disc. iii. quest. 6; Buddei's *Instit. Theol.*

* Psalm xix. 8-12; Rom. ii. 6-10; Gen. xviii. 25; Psalm lviii. 10, 11; lxxiii; Josh. xxiii. 14-16.

Dogm. lib. ii. c. 1, s. 2; Knapp, *Vorlesungen über die Christliche Glaubenslehre*, art. ii. s. 18. Theology.

2. Lord Bolingbroke, among other rejectors of Revelation, censures divines for making any distinction between the moral and physical attributes of the Deity. He insists that the only attributes we can know of, are the Divine power and wisdom, as manifested in the moral and physical world, assuming, at the same time, that in that world no traces of God's moral perfections are to be perceived. As believers in the Bible we should, of course, be unwilling to accept Bolingbroke's theory in exchange for a single line of all which that sacred volume contains of the revelation which God has been pleased to make of His glorious perfections. But what is more, we should also feel called upon to object to any system of religion, like his lordship's, which, so contrary to true theism, would get rid of all knowledge of the moral attributes of God, in order that man may be set free from all obligations to imitate the Deity in those attributes. It might further be objected, that to deny that we can possess any true idea of the moral attributes of the Deity, is to weaken the argument in favour of a future state of retribution. So long as we admit that God is just and good, we cannot but conclude that some time or other He will place a marked distinction between the good and the bad; and, since we do not uniformly see that distinction made in this life, we believe it probable that there will be a future state of rewards and punishments. If, however, we have no knowledge of the justice and goodness of the Deity, this argument must be abandoned. See Leland's *View of the Deistical Writers*, letter xxiii.

3. Whilst upon this subject, we may take occasion further to observe, that those attributes of Deity which are denominated *moral*, are regarded by theologians as belonging to, or connected with, the will of God. Then, the will of God that anything exterior to Himself should take place is technically known as the *Divine decree*. It is scarcely necessary to observe, that it is from the consideration of this attribute of God that those thorny discussions have arisen respecting the *doctrine of the Divine decrees*, and which, at intervals, have agitated the Church. These discussions began during the controversy of Augustine with the Pelagians, were revived in the IXth Century by Gottschalk, and were continued downward, from the schoolmen, in the disputes of the Dominicans and Franciscans, of the Calvinists and Arminians, until the extermination of the Jansenists by the Pope and Jesuits.

Even if space admitted of it, we have no inclination to enter upon the merits of the arguments, on both sides, that bear upon the questions in dispute; for when we reflect that the accuracy of all reasonings connected with the doctrine of the Divine decrees depends on what man can know and comprehend of the liberty of the Divine will, as expressed in the actings of infinite wisdom, justice, and goodness from eternal ages, we feel that we have to do with subjects in the consideration of which the most acute polemic may soon be "in wandering mazes lost."

(12.) But besides that clear development of the Divine attributes which the Scriptures thus afford above all that Natural Religion can supply, no attentive reader of the *New Testament* can help observing the very peculiar manner in which Three personal subjects are repeatedly spoken of in connexion with the

Theology. Godhead. When, for example, the Evangelist* relates the circumstances attendant on the baptism of Christ, we find mentioned the voice of the Father, the Spirit of God, and Jesus, the well-beloved Son. So, again, we are told that in the last charge which Christ gave to His disciples, He bid them baptize all nations in the name of the Father, and of the Son, and of the Holy Ghost;† as in the conversation He had with them before His crucifixion, He had spoken of the Comforter, the Holy Ghost, whom the Father would send in the name of Christ.‡ Then, when the apostles were fulfilling the mission thus assigned to them, we find them writing of “access to the Father through Christ, by one Spirit;”§ and comprehending the sum and substance of all spiritual blessings in “the grace of our Lord Jesus Christ, the love of God, and the communion of the Holy Ghost.”||

(13.) Now, although the texts which have been cited may not, as taken by themselves, prove that the Three personal subjects mentioned necessarily belong to the Divine Nature, and possess equal honour, yet these Scriptures are amply sufficient to shew that Three personal subjects are actually named in connexion with the Godhead; that those subjects are distinguished from each other; and, moreover, that Christ regarded the doctrine of Father, Son, and Holy Ghost to be a fundamental truth in His religion. It remains, therefore, that we examine such Scriptures as mention these three subjects separately, in order that we may thus learn all that has been revealed respecting their personal nature and mutual relationship. As, however, it is generally agreed that when the term “Father” is applied to God, it is intended to designate the whole Divine Nature, we may confine our attention to such portions of Revelation as separately relate to the Son, and to the Holy Ghost.

(14.) And here, in the prosecution of our inquiry, we find all the attributes of Deity to be interchangeably and equally assigned to each of the sacred persons. Thus of the Son it is written, that in Him “dwells all the fulness of the Godhead” (Col. ii. 9); that He is eternal, being before all things (John i. 1, 3; Col. i. 17; John xvii. 5; Heb. xiii. 8); omnipresent (Matt. xviii. 20); omniscient (John xxi. 17; Heb. iv. 12, 13); omnipotent (Phil. iii. 21; Heb. vii. 25; Rev. i. 8). There are also ascribed to Him the works of God, such as creation and providence (Col. i. 15, 16; Heb. i. 3); and the performance generally of such works as are peculiar to God the Father (John vi. 19). Therefore, the Son is consistently addressed by the Divine name, as Jehovah (Numb. xxi. 5, 8, comp. with 1 Cor. x. 9); God (Matt. i. 23; John i. 1; 1 Tim. iii. 16; Tit. ii. 13); Lord (John xx. 28; 1 Cor. ii. 8). And, finally, the Divine worship and honour is required to be yielded to Him equally with God the Father (John v. 23; xiv. 13, 14; Phil. ii. 9, 10). In like manner do we find the attributes and works of Deity ascribed to the Holy Ghost. Being before all things, He is eternal (Gen. i. 2; Heb. ix. 14). He is omnipresent (Rom. viii. 9; 1 Cor. iii. 16); omniscient (1 Cor. ii. 10); omnipotent (1 Cor. xii. 11); and as being called the “power of the Highest,” and the “Finger of God” (Luke i. 35; xi. 20); whilst it is the

Third Person who is said to create the world (Gen. i. 2; **Theology.** Job. xxxiii. 4; Acts iv. 24, 25, comp. with Acts i. 16), to inspire the Prophets, and to enable men to do all those wonderful works which bespoke the present Deity (Acts ii. 4; 2 Pet. i. 21). For these reasons, to the Holy Ghost is ascribed the Divine name, as the Lord, Jehovah (Exod. xvii. 7, comp. with Heb. iii. 7, 9; Numb. xii. 6, comp. with 2 Pet. i. 21; Isaiah vi. 9, comp. with Acts xxviii. 25, 26; 2 Cor. iii. 15–17); God (Acts v. 3, 4; 1 Cor. iii. 16, comp. with vi. 19, 20).

As, therefore, we thus find, in sacred Scripture, the same perfections of Deity ascribed equally to each of the three Divine Persons, it follows that all three are very God, co-equal, co-eternal, co-essential in perfection and glory; in other words, it is an undoubted article of revealed truth, that the object of worship is one God in Trinity, and Trinity in Unity. A few of the passages from which it has been justly gathered that the *Old Testament* teaches the same doctrine, may here briefly be adverted to. The plural form of the word *Elohim*, joined as it is with a singular verb, although it may not of itself prove the doctrine, at least harmonizes beautifully with it. Again, the use of the plural number in describing the counsel of the Divine Being respecting the creation of man,—“Let us make man in our image” (Gen. i. 26), indicates the same great truth. To these indications may be added the *trisagion* used in Isaiah vi. 3.

Again, an unequivocal testimony to the Divine nature of the Messiah is afforded by many of the prophetic declarations concerning Him. He is called “the Mighty God,” “the Everlasting Father,” “the Son of God,” and “God” (Isaiah ix. 6; Psalm ii. 7, xlv. 6; Psalm xc. 1, comp. Heb. i. 5–13). With these and similar indications may be taken the remarkable declaration of Malachi (iii. 1), that “the Lord” should come to his temple,—a prediction which the Jews themselves applied to the Messiah.*

The Spirit of God is also spoken of in many passages of the *Old Testament*, which are justly conceived to apply to the third person in the Divine Trinity (e. g. Gen. i. 2; Job xxvi. 13; Psalm civ. 30; Isaiah xi. 2, lxi. 1). So interwoven, indeed, is this fundamental article of belief with the very frame and texture of revelation, that no man can explain the *Bible* in its unimpaired integrity without taking this doctrine for granted.

Nor is the information which revelation contains respecting man less important than all it teaches respecting the Deity. Every conjecture which human reason can suggest as to the degenerate state of man is authoritatively verified; and much more is told us respecting the human race, in their relation to God, than without revelation we could possibly have known.† Thus, we read that man was originally created in the image of God; and that he was upright (Gen. i. 26; Eccles. vii. 29). And, if we ask why then so little of this godlike original is found in the world as it now is, revelation teaches that disobedience to the command of God brought sin into the world, “with all our woe:” that it was in Adam that we all died; that from our

* We may also mention, as a very prevalent opinion of divines, that all the *Theophanies* recorded in the *Old Testament* relate to the Son.

† Horn on the *Misery of Man*.

Theology. first parents are derived, to their latest posterity, all that blindness of heart, all that unholiness of affections, those corrupt imaginations and desires, and those evil workings of the mind, which issue in overt acts of sin (*Rom. v. 12, 14, 17-19; 1 Cor. xv. 22; Job xiv. 4; Psalm i. 5*). We thus become acquainted with the important truth, that every man who is naturally engendered of Adam is very far gone from original righteousness; is of his own nature inclined to evil; and is, from his birth, obnoxious to God's righteous judgment. If now we take into account the actual turnings aside from God,* the cursing and bitterness, the swiftness to shed blood, the destruction and misery, and those many depraved works of the flesh which afflict human society at large, and degrade individuals, we are prepared to understand that the moral condition of man with reference to his Maker is that of wretchedness and condemnation.

The true extent of the misery of this condition is not, however, felt until we perceive that, in ourselves, we are not in circumstances to deliver our own souls from impending judgment. Our experience scarcely needs the testimony of revelation to convince us that we are not able to change the natural ungodliness of the heart and affections into "faith and calling upon God;" that we are not competent to remove from ourselves the guilt contracted by sin; nor to regain those paths of righteousness from which all by nature stray. As, also, our natural tendencies are not Godward, and indulgence in sinful habits more effectually blunts the moral feelings and perceptions, each successive day spent in forgetfulness of God renders our natural condition only the more hopeless. In the mean while the *Bible* reveals to us that "the wicked shall be turned into hell, and all the nations that forget God:" that "indignation and wrath, tribulation and anguish," must be the inevitable portion of "every soul of man that doeth evil," without respect to person, age, or nation. The undefined forebodings of the natural conscience are thus realized in the fearful certainty of a revelation "from heaven" of God's wrath "against all ungodliness and unrighteousness of men;" so that the most prosperous career of vice is nothing better than a "treasuring up of wrath against the day of wrath" (*Psalm ix.; Rom. i. 18; ii. 8, 9; iii. 19*).

It is at this juncture that revelation brings us acquainted with the forgiving love of God through a *Mediator*. We find the promise of a Redeemer recorded contemporaneously with the history of that sin and death which entered the world by our first parents' disobedience. We see this promise to be from time to time renewed, with more or less clearness and detail of circumstances, until the actual appearance of the Mediator in the flesh. But that appearance was so little after the usual fashion of mankind, that the testimony of revelation can alone unfold the wondrous history of God's well-beloved Son. Begotten from everlasting of the eternal Father; of one substance with the Father; the very and eternal God; He took man's nature in the womb of a virgin mother, and of that mother was born into the world, yet without sin. It was thus provided that in this Redeemer's person the Divine and human nature should be inseparably united, that as the reasonable soul and body is one man, so God and man might be one Christ. Thus constituted to be the propitiation for the sins of a fallen world, this perfect God

Theology. and perfect man died upon the cross, that the "chastisement of our peace" might be "upon Him," and that "by His stripes we might be healed." He died and was buried; rose again from the dead; ascended into heaven; and now appears in the presence of the Almighty Father as our everliving intercessor. Thus, as transgression came by man, so satisfaction was made by man; as the offence of sin is against God, so reconciliation was purchased by the merits of the Son of God. (*Psalm ii. 7; John i. 1-14; Luke ii. 40; 1 Tim. ii. 5, 6; Phil. ii. 6, et seq.; 1 John ii. 1, 2, et alib.*)

The Scripture revelation of a Mediator solves therefore the difficulty which Natural Religion cannot explain. The Deity is here revealed to us as a "just God, and yet a Saviour;" as so tempering His justice and mercy together that He neither condemns sinful man to remediless misery, nor by His mercy delivers us without a just ransom. That ransom, however, having been fully provided in the sufferings and death of Christ,* the justice of God and His mercy embrace together and fulfil the mystery of our redemption. Yet as redemption, like every other blessing, can profit those only who are personally the subjects of it, it remains for us to ascertain how "this great salvation" becomes available to all who desire to partake of it. On this point the Scriptures teach that, "As Moses lifted up the serpent in the wilderness, even so must the Son of Man be lifted up; that whosoever believeth in him should not perish, but have eternal life. For God so loved the world that he gave His only-begotten Son, that that whosoever believeth in Him should not perish, but have everlasting life: He that believeth on him is not condemned; but he that believeth not is condemned already." (*John iii. 14-18; comp. John xx. 31; Acts xx. 31; Rom. iii. 26, v. 1, x. 4, et al.*) We thus learn that whilst "we are accounted righteous before God only, for the merit of our Lord Jesus Christ, and not for our works and deservings;"† the "mean and instrument of our salvation required on our parts is Faith; that is to say, a sure trust and confidence in the mercies of God,‡ whereby we persuade ourselves that God both hath and will forgive our sins; that He hath accepted us again into His favour; that He hath released us from the bonds of damnation, and received us again into the number of His elect people; not for our merits or deserts, but only and solely for the merits of Christ's death and passion, who became man for our sakes, and humbled himself to sustain the reproach of the cross, that we thereby might be saved, and made inheritors of the kingdom of Heaven."

When, however, we find so much written in commendation of faith, that by it alone we are said to be justified, it is not meant that he who exercises such a faith can at any period be without true repentance,§ hope, charity, and the reverent fear of God. Nor when the Scriptures declare that we are justified freely by God's grace, is it to be concluded that nothing is required on our part afterwards. Nor is it intended to exclude or supersede the necessity of union with our Saviour in his church and in his sacraments, through which the benefits of our Saviour's passion are made available to man.||

Theology.

The Scriptures ascribe the merit and deserving of our justification wholly and solely to the abundant grace of God in Christ Jesus, apprehended by faith; yet nothing is more evident than the declarations which speak of this faith as a principle which cannot lie dormant, but which is always bringing forth some good work; and inseparably connected with an earnest endeavour to obey God's commandments in all holiness of life; a fear to offend so merciful a Redeemer; a readiness to do good to every man; and "above all things, and in all things, to advance the glory of that God of whom only cometh our salvation." Thus is it that by good works the faith which justifies may be as "evidently known as a tree is discerned by its fruits;" and thus every Christian man is diligently working out his "own salvation with fear and trembling at the very time that his faith leads him to depend solely on God to work in him both to will and to do of His pleasure."

This inworking of faith and holiness the Scriptures represent to be effected by the power of the Holy Ghost. It is that sacred Person of the blessed Trinity who so acts upon the hearts of men that they become possessed of convictions respecting themselves and their need of salvation, which, without His sacred influence, they would never have had. From Him proceed those fruits of faith which "are pleasing and acceptable to God in Christ."* He, in a word, "is the only worker of our sanctification, and makes us new men in Christ Jesus."

Thus does the Scripture revelation of God, as Father, Son, and Holy Ghost, appear not as a merely speculative doctrine, but as a fundamentally practical truth. For as salvation, with all its present concomitant blessings, originates in the grace and favour of God the Father, so is it bestowed and comes to man only for the sake of God the Son, nor by the Son but through God the Holy Ghost.† Yet by this threefold Divine agency it has been provided that those who by nature are sons of Adam, and who, as Adam's offspring, partake of the sinfulness of that nature from which they derive their origin, become, in the second Adam, God the Son, children of the Most High, by a spiritual and heavenly birth; and are separated from the world as a holy people unto the Lord, by the indwelling power of the Holy Spirit.

Such being the wonderful provision made for the rescue of mankind from sin and death eternal, and to bring them to holiness and everlasting life, it were a dishonour to the mercy and love of God to suppose that the Divine counsel had not secured that a knowledge of the great mystery of redemption should be perpetuated to all generations. We are thus brought to consider the means provided for the preaching of the Gospel, or man regarded as a member of the Church.

Obs. 1.—The sects against which the Church has had to maintain the great fundamental doctrines of the Trinity, the divinity of our Saviour and of the Holy Spirit, are the Arians and Socinians. The latter deny also the doctrine of the Atonement and

on Salvation (referred to in the eleventh article) uses the word baptized as equivalent to justified in the following passage: "Our office is not to pass the time of this present life unfruitfully and idly, after that we are baptized or justified, not caring how few goods works we do to the glory of God and profit of our neighbours," &c. *Homily on Salvation*, part iii.

We must be careful, in all our considerations on the subject of justification, always to distinguish between justification, sanctification, and final salvation, the two former being essential to the last.

* *Homily for Whitsunday.*

† Hooker, v. c. 56.

the personality of the Holy Ghost; while the Arians, who admit the pre-existence of our Lord and the personality of the Holy Ghost, recognise the doctrine of the Atonement, and acknowledge an inferior divinity both in the Son and Holy Ghost. It was chiefly against Arianism that the early Church had to contend; and for a history of the controversies in early ages, we must refer to the historical portions of this *Encyclopædia*, especially vol. iii. chap. liv. p. 326. The works of Bishop Bull, Bishop Horsley, and Dr. Waterland, will be found very useful in all that relates to the Trinity. Dr. Burton's *Testimonies of the Ante-Nicene Fathers to the Doctrines of the Trinity and the Divinity of our Lord*, are a very admirable supplement to those of Bishop Bull; and Mr. Newman's *History of the Arians of the Fourth Century* gives a very lucid summary of the points, as discussed at that season.

Our object has been to adhere as closely as possible to the very language of our Church on the subject of man's sinful state, and his recovery by Jesus Christ, it being our desire to recognise no other human authority in regard to a doctrine of so much importance. To understand, however, fully the language of our articles on these points, an historical knowledge of the opinions held respecting them previous to the Reformation is an admirable assistance, if not rather an indispensable requisite. In this respect the *Bampton Lectures* of the late Archbishop Laurence will be found extremely useful. The writers who have treated on the various subjects included under what are usually termed "The Five Points," are by far too numerous to be specified; and as most of the common works on Divinity give references to them, it seems superfluous to attempt it here.

Obs. 2. We may here conveniently state some of the peculiarities of the Socinian views in regard to the state of man. It must, however, be premised, that modern Unitarians' views differ very widely from those of the older Socinians, and include many shades of opinion; and some, indeed, who call themselves Unitarians, differ from moral Deists only in believing that the miracles and resurrection of our Saviour prove the truth of a future state.

The Socinians hold that man's condition now is similar to that of Adam, and that consequently there is no such thing as original sin—that the death denounced against Adam was only a denunciation of future punishment to sin—that man does not require the grace of God to begin good, but to bring it to perfection—that man's will is free to good (while many modern Unitarians hold the doctrine of philosophical necessity)—that moral virtue is the only ground of salvation, which salvation is nevertheless a free gift of God.

The older Socinians acknowledged a prophetic, priestly, and regal office in Christ; the first in preaching the Gospel; the second in his office in heaven, which is nearly identical with (3) his regal office. But modern Unitarians are far from attributing that dignity to Christ after his resurrection which the older Socinians did not deny. Justifying faith, according to them, is only trusting to the promises of God, and a consequent obedience to them.

These opinions are merely stated here; but it does not seem requisite to discuss them, as the opinion of the mere humanity of our Saviour, upon which the whole system rests, is utterly irreconcilable with the whole scheme and language of Scripture, and is entirely rejected by the concurrent testimony of Christian antiquity.

The following extracts from Dr. Berriman's *Moyer's Lectures* for 1723 and 1724 (the subject of which is an historical account of the Trinitarian Controversies), may be found useful in illustrating some portion of the preceding chapter.

Extracts from Dr. Berriman.

"The doctrines of Socinus were by some of his followers methodized and digested into regular systems, and by others defended against the various objections, whether of *Romanists* or *Protestants*. A scheme it was which did entirely change the whole nature and design of Christianity. It not only took in that grand point, in which the *Sabellians* and the *Arians* agreed, that the Supreme Deity is personally but one, concurred also with the latter, that our blessed Saviour is not *God over all*; and with the former, that the Holy Spirit is only a divine influence, without any personal subsistence; but it went on with *Artemon* and others to deny that Jesus Christ had any real existence before his birth of the Virgin; and its patrons having set up private judgment as their supreme rule, concluded from the whole, more impiously, indeed, but still more consistently than former heretics, that whatever is said of the merit and satisfaction of Christ, his sacrifice for sin, and his redemption of sinners, his unchange-

Theology.

Theology. able priesthood, and intercession for us at God's right hand, has altogether a metaphorical or figurative meaning, widely different from that in which the Church had always understood and made use of those expressions. To these, if we add the many other errors of this newfangled scheme, concerning the constitution of the Christian Church and the appointment of its *ministry*, the efficacy of its *sacraments*, and the secret *operations* of Divine *grace*, the interpretation of *Scripture*, and the *rules* of Christian *obedience*, the state of the *soul* after death, the *resurrection* of the body, and the future *judgment*, we shall have cause to say that there was never any heresy that did so artfully disguise so great a number of impieties as this *hydra* of *Socinianism*; which made so low an account of the unfathomable mystery of our *redemption*, that there can be little ground to wonder if, besides the *judaizing* errors already mentioned, there should be some who apostatized (as *Socinus* himself could not entirely disown) into Mahometism, or into downright *Atheism*; nay, even if some of those who did not openly apostatize, should yet boast of their agreement with the followers of *Mahomet* in their notions of the Divine unity, and their little difference from them in respect of Christ." (Berriman, p. 410.)

* * * * *

"It was not long after this [the publication of a translation of Biddle's *Catechism*, about 1665] that *Sandius* published his *Ecclesiastical History*, manifestly calculated for the service of the Arian cause, and to persuade his readers that till the time of the *Nicene* Council the Catholics had those very sentiments which were then embraced by *Arius* and his associates, and all who differed from them in these points had been esteemed as hereticks. This groundless calumny (which had been but too much countenanced by the writings of *Petavius*, though with a different view) gave

occasion to that admirable *Defence of the Nicene Faith* which was drawn up by our incomparably learned Bishop *Bull*, in opposition at once to the Arian and the *Jesuit*; and which was afterwards followed by his other treatise of the *Judgment of the Catholic Church concerning the Necessity of believing Christ's Divinity*, in opposition to *Episcopius* and his *Remonstrant* brethren. Meanwhile the controversy which prevailed chiefly among us was not upon the *Arian*, but *Socinian* scheme; though as *Sandius* had plainly showed his opinion, that there was nothing which should hinder those two parties from communicating with each other, so the *Socinians* were generally of the same mind, and content to join with such as advanced somewhat higher than themselves, provided they denied the Son's proper and essential divinity. Some of them adhered to Biddle's scheme already mentioned, but the greater part seem to have embraced the grossest sort of *Socinianism*, as well by disowning the personality of the Holy Ghost as disclaiming likewise all worship or invocation of Christ, for which the Polish *Socinians* would doubtless have rejected their communion. (Berriman, p. 424.)

Dr. Berriman then proceeds to mention Dr. *Sherlock's Vindication of the Doctrine of the Trinity*, which some persons charged with Tritheism, and Dr. *South's Animadversions upon Dr. Sherlock*, which was again charged by others with Sabellianism, and to intimate the advantage taken of this dispute by the Unitarians of those days. Some of the Unitarians then acknowledged themselves ready to conform and use the expressions of the Church of England, provided they might by persons understand only *modes* or *names* of relations. This, of course, was only a form of Sabellianism.

For a short account of the controversy in later days, see the Historical Division of this *Encyclopædia*, vol. v. p. 1139-40.

Theology.

OUTLINES OF THEOLOGY.

CHAPTER IV.

The Doctrine of Scripture respecting the Church, and respecting a Future Life.

Theology. **HAVING** now considered the chief substance of the revelation of God respecting the nature and attributes of the Deity, and the relation between God and man as a fallen and sinful being, needing restoration to God's favour, and assistance from on high,—needing pardon, justification, and sanctification,—we proceed further to view the means by which these gracious purposes of God are applied and brought home to individuals. In the Scriptures is found the substance of that communication from God through which each man is to become capable of salvation; but we ask at once—was this communication left in the world to make its own unaided way to the heart of each individual, or was the propagation and maintenance of the truths contained in it enjoined on a distinct body of men, and all who receive that truth gathered together into one body? * The answer to this inquiry is obvious. The doctrine of redemption, as preached to man, clearly implies a society; and Scripture, speaking of this society, calls it the Church. We therefore now proceed to inquire what Scripture teaches us concerning the Church.

The Church.

In commenting upon that portion of the creed in which we profess our belief in “the holy Catholic Church,” Bishop Pearson observes, that our Lord, in first speaking of this Church, spoke of it as that which as yet was not.† Thus he said to St. Peter, “And upon this rock I will build my Church” (*Matt. xvi. 18*). But when he had ascended into heaven, and the Holy Ghost had come down—when Peter had converted three thousand souls (*Acts ii. 41*), which were added to the hundred and twenty disciples (*Acts i. 15*), then there was a Church (and that, too, built upon St. Peter,‡ according to our Saviour's promise); for after that we read “the Lord added to the Church daily

such as should be saved”* (*Acts ii. 57*). “A Church, then, our Saviour promised should be built, and by a promise made before his death. After his ascension, and upon the preaching of St. Peter, we find a Church built or constituted, and that of a nature capable of daily increase.” (Bishop Pearson, *On the Creed*, p. 542, Dobson's edition.)

Without entering into the questions, to which we must hereafter recur, as to the catholicity and external unity of this Church, we may observe that it is seldom denied that such a body as the Church exists and is supposed in Scripture; but the great differences which exist among men in regard to it relate to its nature and constitution.

If we inquire from Scripture what is the meaning of the term (*ἐκκλησία*) rendered *Church*, we shall perceive that it is a word which in Greek means an assembly or congregation, with the notion of being “called forth;” and in the *New Testament* it always signifies a company of persons professing the Christian religion. “Sometimes,” observes Bishop Pearson, “the Churches of God are diversified as many; sometimes, as many as they are, they are all comprehended in one.” Thus “the Churches” are mentioned *Acts xvi. 5*; *1 Cor. xiv. 34*, &c.; “the Churches of God,” *2 Thess. i. 4*; *1 Cor. 15, 16*; “the Churches of the Gentiles,” *Rom. xvi. 4*; “the Churches of the saints,” *1 Cor. xiv. 33*. Sometimes we read of a church as designating a few believers gathered together in one house, as the Church in the house of Priscilla and Aquila (*1 Cor. xvi. 19*). So also we read of the Churches of Samaria and the Churches of Asia, meaning the Christian congregations in those districts. But then we observe, that even when the Scriptures speak of many such congregations in great cities, they speak of them under the notion of one Church. Thus St. Paul writes to the Corinthians, “Let your women keep silence in your Churches” (*1 Cor. xiv. 34*). But yet the dedication of the epistle is “To the Church of God which is at Corinth” (*1 Cor. i. 2*).

Now just as these many *Congregations* formed one *Church*, so these many *Churches* formed one *Church* under Christ, the great bishop of our souls; and in this sense we speak of THE CHURCH as the great society founded by our Lord.

We find, therefore, that the Church was considered as a society built upon the foundation of Jesus Christ; and from other parts of the Scriptures, especially the Epistles of St. Paul, we gather that this society was furnished with its own officers and ministers, and that it had its own ceremonial of worship and sacramental

* The Bishop of London, in his *Three Sermons on the Church* (London, 1842), has cited a very striking sentence on this point from Archbishop Bramhall (*Works*, p. 615): “If he think that Christ left the Catholic Church, as the ostrich doth her eggs in the sand, without any care or provision for the governing thereof in future ages, he erreth grossly.” To which Bishop Blomfield adds the following remark: “It is expressly asserted by Clement of Rome, a companion of the Apostles, that such provision was made by them.” (*Three Sermons*, &c., p. 32.)

† By this assertion we need not understand the bishop to speak as if the Jewish Church had nothing to do with the Christian. We may understand it of the Church as peculiarly a Christian Church, founded not merely, as the Jewish Church was, on the belief of a future Messiah, but on the belief of that Messiah having come in the person of our Lord and Saviour Jesus Christ. The Church may be viewed as existing from the earliest ages, and continuing to the present day, as the Patriarchal, the Jewish, and the Christian Church. The assertion of Bishop Pearson will apply to it, as the *Christian Church*, without considering it a new creation, independent of the former developments of the Church.

‡ See Tertull. *De Pudicitia*, c. 21; and Basil. *Adv. Eunom.* l. ii. sec. 4.

* Some useful remarks on the meaning of the phrase will be found in the Bishop of London's *Three Sermons on the Church*.

Theology. observances. The two last particulars are indicated in the *Acts of the Apostles*, where it is said of the disciples that they continued stedfastly in the Apostles' doctrine and fellowship, "and in breaking of bread and in prayers." (*Acts* ii.)

Reserving to a later portion of this chapter some notice of the nature of the connexion between various branches of this great body, and the means of distinguishing the true Church of Christ amid contending bodies, who claim, each for themselves, that holy name, we shall now briefly consider the polity, the sacraments, and the ceremonial of the Church of Christ.

Sect. 1.—Of the Polity of the Church of Christ.

Polity of the Church.

The general character of the Christian Church in the Apostolic age and the time of the Apostolic Fathers has been so fully treated in the Historical Division of this work, and under the word **BISHOP** in the Miscellaneous portion, that it is needless to repeat in this place the statements there made; and we merely request that the following observations may be considered as supplementary to those articles.

Ministers.

On inquiring into the nature and constitution of the Christian Church, as laid before us in Scripture, we find that certain offices are there mentioned as being already appointed. If we examine the *Epistle of St. Paul*, we shall find (besides some orders of men possessing the extraordinary gifts of the Spirit, as, for example, *prophecy* and the gift of *tongues*, &c., as mentioned *Ephes.* iv. 11, and *1 Cor.* xii. & xiv., that three orders of men are mentioned as bearing a share in the ministry of the Church; viz., Bishops, Elders or Priests, and Deacons; of which names the two first are used in Scripture with some latitude and ambiguity.

Ordination.

It is shown, by arguments which admit of no answer, that the Apostles did ordain ministers by the imposition of hands, and did give them authority to ordain others; as, for example, Titus in Crete, and Timothy in Ephesus (*See 1 Tim.* iv. 14; *Tit.* i. 5). Nor is there, in the reason of the thing, any cause why this ordinance should last for one or two generations, and then be discontinued; but, on the contrary, every reason would lead us to consider it a permanent and perpetual appointment. And accordingly we find that in the Universal Church this was taken as a noted and fundamental point. No one was considered capable of transmitting the grace of the Holy Spirit, which gives men authority and power to minister in things pertaining unto God, except such as had received it themselves by spiritual succession from the Apostles. Nor is it denied by the more learned of the opponents of episcopacy that the government of the Church and the ordination of its ministers was restricted to bishops as early as in the age immediately succeeding the Apostles. The acute Chillingworth has drawn from this a conclusive argument for the Apostolic origin of the Episcopate.

"Episcopal government," he says, "is acknowledged to have been universally received in the Church presently after the Apostles' times. Between the Apostles' times and this presently, there was not time enough, nor possibility of so great an alteration" [as that from Presbyterial to Episcopal government], "and therefore there was no such alteration as is pretended; and therefore Episcopacy, being confessed to be so ancient and catholic, must be granted also to be Apos-

tolie—*quod erat demonstrandum.*" (Chillingworth, *The Theology. Apostolical Institution of Episcopacy Demonstrated.* Works, vol. ii. p. 531—537.)

As the offices of Bishop and Deacon have been fully treated of in other parts of this work (*see* Hist. Div. vol. ii., and Miscell. Div. vols. ii. and iv., articles **BISHOP** and **DEACON**), we do not enlarge upon this subject, but simply observe, that the British Bishops may be proved to derive their orders in unbroken succession from Apostolic times; and their authority in this country may be traced to its earliest conversion. Hence every authority due to an Apostolic Church may be lawfully claimed by them.

Obs. 1. The subject of Episcopacy has been so frequently handled by our most eminent divines, that it would be almost impossible to enumerate the names of their treatises upon it. Bishop Taylor, Bishop Hall, and Archbishop Bramhall, ably maintained the cause of Episcopacy; and Dr. Hammond has answered the arguments of the Presbyterian divines of the XVIIth Century. In later times, Leslie, in his *Essay on the Qualifications to administer the Sacraments*, and Bennet, in his *Rights of the Clergy*, and his *Discourse of Schism*, also have ably maintained the cause. For more specific references to these great storehouses of argument, and for a very lucid and admirable summary of their substance, we must refer to the *Sermons on the Commission and consequent Duties of the Clergy*, by the late Rev. Hugh James Rose; to the Rev. W. Palmer's *Treatise on the Church*; to Bishop Blomfield's *Three Sermons on the Church*; and Bishop Onderdonk's *Episcopacy tested by Scripture*. Amongst other older works, however, we must just mention Field, *Of the Church*, as deserving especial attention.

If, on this subject, any individuals prefer their own views to the universal and uninterrupted practice of the Church for nearly 1600 years, we do not mean to argue the question with them. With those on whom such an argument has no effect, we should not expect any reasoning we could offer, to prevail. There is one point, however, which, not having been previously considered, requires a passing notice. It is the story known by the name of *The Nag's Head Fable*, by which the less respectable of the Roman Catholic writers attempt to discredit the consecration of Archbishop Parker. We may add also that some of the more respectable writers of that communion, from a want of information on the subject, have given currency to this disreputable fabrication. *See* especially Massuet, in his *Notes on Irenæus*, vol. ii. p. 105.

The following remarks are from the notes to the *Sermons on the Commission and consequent Duties of the Clergy*, above referred to.

"It is curious that they who attacked the English ordinations did so inconsistently.

"First,—they alleged that King Edward's ritual for ordination was bad. Next, they said that bishops consecrated by men who were separate from the Church, and had no authority or jurisdiction, were no bishops; confounding the difference between the powers of ordination and of jurisdiction. Then marriage, they said in their ignorance, made the consecration of bishops void. Ashamed of all these stories, they next said that the new bishops had not been consecrated at all by imposition of hands. Finally, they brought up the Nag's Head story. This story was first told by a Jesuit, called Sacro Basco, or Holywood, in 1604, forty-five years after Parker's consecration! Kellison, a Romanist writer, knew nothing of this story in his first book, but published it in his second!"—Rose's *Sermons*, p. 227.

We now add Archbishop Bramhall's account of the Nag's Head fable (*Works*, p. 436), quoted in the same book as the shortest and fullest refutation of the story. It is as follows:—

"They say that Archbishop Parker and the rest of the Protestant bishops in the beginning of Queen Elizabeth's reign, or at least sundry of them, were consecrated at the Nag's Head in Cheapside, together, by Bishop Scory alone, or by him and Bishop Barlow, without sermon, without sacrament, without solemnity, in the year 1559 (but they know not what day nor before what public notaries), by a new fantastic form. And all this they, on the supposed voluntary report of Mr. Neale (a single malicious spy), in private to his own party, long after the business pretended to be done.

"We say that Archbishop Parker was consecrated alone at Lambeth, in the Church, by four bishops, authorized thereunto by Commission under the Great Seal of England, with sermon,

Theology. with sacrament, with due solemnities, on the 17th day of December, anno 1559, before four of the most eminent public notaries in England, and particularly the same public notary was principal actuary both at Cardinal Pole's consecration and Archbishop Parker's. And that all the rest of the bishops were consecrated at other times, some in the same month, but not upon the same day; some in the same year, but not the same month; and some the year following. And to prove the truth of our relation, and falsehood of theirs, we produce the register of the see of Canterbury, as authentic as the world hath any; the registers of the other fourteen sees then vacant, all as carefully kept by sworn officers as the records of the Vatican itself. We produce all the commissions under the Privy Seal and Great Seal of England. We produce the rolls and records of the Chancery; and if the records of the Signet Office had not been unfortunately burned in King James's time, it might have been verified by them also. We produce an Act of Parliament, express to the point, within seven years after the consecration: we produce all the controverted consecrations published to the world in print, anno 1572, three years before Archbishop Parker's death, whilst all things were fresh in men's memories."

Obs. 2. We must not omit simply to state that some men, especially the Puritans (see Hooker, book v. sec. 78, note, where he quotes Cartwright), have objected to the use of the word Priest in respect to a Christian minister, as implying "a sacrificer." Hooker, to avoid disputes, agrees in some degree to forego the use of the word, and says, "I rather term the one sort presbyters than priests, because in a matter of so small moment I would not willingly offend their ears to whom the name of priesthood is odious, though without cause." But it must be remembered, that although we repudiate the Roman Catholic sacrifice of the Mass, in which it is declared that the priest offers Christ upon the altar a propitiatory sacrifice for the living and the dead, we acknowledge in another sense a sacrifice in the Eucharist. The oblation of the gifts is a sacrifice in one sense; and, at all events, the prayer and praise there offered to God may most justly be called a spiritual sacrifice; and in this sense it is difficult to see how any offence can be engendered by the use of the term Priest. But this controversy is too wide to enter upon here. We refer for further information to Dr. Waterland on the *Eucharist*; to Mr. Palmer, *Treatise on the Church*, pt. ii. ch. viii.; Bishop Burnet and other writers on Art. 31, &c.

Sect. 2.—*The Ceremonial, Liturgy, and Sacraments of the Christian Church.*

Ceremonial of the Church.

As the worship of God is one of the principal objects of the Christian Church, it is clear that some external ceremonial must be prescribed in it upon competent authority. The notices contained in Scripture with regard to this point are undoubtedly rather scanty, but they are sufficient to guide us in the main objects of Christian worship, without fettering particular churches as to the minute details of the manner in which the great object is to be effected.

The public worship of God is particularly specified in Scripture, and "the breaking of bread and prayers," of which we read (*Acts* ii. 42), may be considered to include both the ordinary provision for this purpose, and the celebration of the Lord's Supper.

Forms of Prayer.

As the subject of Liturgies has been treated at considerable length in the Miscellaneous Division of this work, under the article LITURGIES, we shall not here dwell upon the various topics connected with the mode of conducting Divine worship. We may, however, refer to one or two works not mentioned in that article. In the able treatise of T. Bennet, entitled *A brief History of the joint Use of precomposed set Forms of Prayer*, &c., by T. Bennet, M.A. (2nd edit. 1708), will be found a most elaborate discussion, to show that "the ancient Jews, our Saviour, and his Apostles, never joined in any prayers but precomposed set forms only;" that these forms were such as the congregations "were accustomed to, and thoroughly acquainted with;" and that "their practice warrants the the imposition of a national precomposed Liturgy."

VOL. II.

Theology. It is from this valuable work that Wheatley's *Preface to the Illustrations of the Common Prayer* (referred to under LITURGY) is almost entirely drawn, and the work is here mentioned because it well deserves a most attentive perusal, as the results to which it leads us are of great importance.

Another work* of great value, lately published, deserves mention here, viz., Mr. Palmer's *Origines Liturgicæ*. A considerable portion of that work is devoted to the elucidation of the antiquities of the English Liturgy and Ritual, &c., but there is prefixed to it a most valuable dissertation on ancient Liturgies, to which we would direct especial attention. The information there condensed is only to be obtained from many scattered sources (although much of it is to be found in Renaudot's *Liturgiarum Orientalium Collectio*), and is nowhere else so lucidly arranged.

Some important results appear to follow, from the arguments adduced in this dissertation, relative to the condition of the primitive Liturgies. Mr. Palmer observes, in his introduction, "It seems to have been often assumed by the learned, that there was originally some one Apostolic form of Liturgy in the Christian Church, to which all the notices which the Fathers supply might be referred. Were this hypothesis supported by facts, it would be very valuable. But the truth is, there are several different forms of Liturgy now in existence, which, as far as we can perceive, have been different from each other from the most remote antiquity. And with regard to the apparent propriety of the Apostles instituting one Liturgy throughout the world, it may be observed, that it is quite sufficient to suppose all Liturgies originally agreed in containing everything that was necessary for the due celebration of the Eucharist; but that they adopted exactly the same order, or received everywhere the same rites, is a supposition equally unnecessary and groundless."—p. 5, 6.

Mr. Palmer afterwards observes (*Introduction*, p. 8), "after a careful examination of the primitive Liturgies of the Christian Church, it appears to me that they may all be reduced to four, which have been used in different churches from a period of profound antiquity." These are,—

1. *The Great Oriental Liturgy*, used in all churches from the Euphrates to the Hellespont, and from the Hellespont to the southern extremity of Greece.
2. *The Alexandrian*, used from time immemorial in Egypt, Abyssinia, &c.
3. *The Roman*, used in Italy, Sicily, and the civil diocese of Africa.
4. *The Gallican*, used in Gaul and Spain, and probably in the exarchate of Ephesus, till the IVth Century.

These Mr. Palmer considers the parents of all existing forms of Liturgies; and he adds, that their antiquity was so very remote, their use so extensive in those ages when bishops were most independent, that it seems difficult to fix their origin at a lower period than the Apostolic age.

* The mention of Mr. Palmer's work renders it superfluous to enumerate other writers on the subject besides those referred to under LITURGIES. There are such ample references to *Assemani*, *Renaudot*, *Goar*, *Gavanti*, *Bona*, &c., and other writers, both of the Romish communion and others, that any person reading Mr. Palmer's work will be able to pursue the subject as far as he may be inclined.

Theology. The elementary members* of which these Liturgies consisted were for the most part the same, but they appear to have varied chiefly in the order in which these parts were arranged. Those belonging to each of these great families resembled the others used in the same ecclesiastical districts in their arrangement, but differed from those of the other families. Thus, in all *Alexandrian* Liturgies, the general prayers for men and things occurred in the middle of the Eucharistia or thanksgiving, and before the hymn *Ter sanctus*; while in the *Oriental* Liturgies the general prayers are deferred till after the end of the benediction of the gifts. (Palmer, p. 99.)

This substantial uniformity, under circumstantial variation, is certainly a remarkable phenomenon; and to those who would study it in all its bearings we recommend the work of Mr. Palmer. Another very valuable portion of his book is the answer contained in the second volume to the objections of Dr. Brett and others (especially non-jurors), against our office for the Holy Communion.

Having made these few observations on the subject of Liturgies, we proceed to consider next the Sacraments of the Church.

It is perhaps needless to refer more particularly to writers upon the *Book of Common Prayer*. The *Appendix* to Dr. Nicholls's *Paraphrase*, consisting of *Notes* from Bishop Andrewes, Bishop Cosins, &c., is very useful. H. L'Estrange's *The Alliance of Divine Offices*, Dr. Comber's *Companion to the Temple*, Bishop Sparrow's *Rationale of the Common Prayer*, Wheatley, and the more modern work of Shepherd, will all be found of value in the elucidation of the *Book of Common Prayer*, as well as the edition of it with notes by Bishop Mant, the *Liturgy compared with the Bible*, by Mr. Bailey, Keeling's *Liturgiæ Britannicæ*, and Clay's *Book of Common Prayer*.

Sect. 3.—Of the Sacraments of the Church.

In the definition of a sacrament given in the *Catechism of the Church of England*, it is stated to be "an outward and visible sign of an inward and spiritual grace, given unto us, ordained by Christ himself as a means whereby we receive the same, and a pledge to assure us thereof." The previous question is, "How many Sacraments hath Christ ordained in his Church?" and the answer is, "Two only, as *generally necessary to salvation!* that is to say, Baptism and the Supper of the Lord."

By these answers, we learn what our Church considers requisite to form a Sacrament, properly so called.

1. It must have been appointed or ordained (as to its outward sign) by Christ himself.
2. It must be *generally necessary* to salvation, and thus needful, under ordinary circumstances, for all men.
3. The sign, of which it partly consists, must be an outward and visible sign.
4. This sign must be a sign of an inward and spiritual grace.
5. It must be also the means of conveying that grace, as well as a token that we receive it.

By these conditions, or by some of them, the other five ordinances called Sacraments by the Romanists, viz.,—*Confirmation*, *Penance*, *Orders*, *Matrimony*, and *Extreme Unction*, are excluded from the rank of Sacraments, according to the views of our Church.

* By *Liturgy*, it will be seen that we here mean what we call *Communion Service*; and the elementary members of which we speak are, the prayers for all conditions of men, the oblation of the gifts, the *Sursum Corda*, the *Ter sanctus*, &c.

Theology. The Roman Catholic Church (*Concil. Trid.*, Sess. vii. 1), pronounces an anathema against all who affirm that the number of sacraments is more or less than *seven*, and joins with this declaration the same anathema against every one who denies that all of these were instituted by Christ. It is needless to enter much at length into this discussion, as the number of sacraments which men allow must clearly depend on their *definition* of a sacrament. The language of the articles and homilies sometimes seems to admit that other rites may be called sacraments, but in *another sense*; and much to the same purpose is the language of Melancthon, in his *Loci Theologici* (*De Numero Sacramentorum*). The subject had been much discussed in the time of Henry VIII. See the answers of the Bishops to the queries sent to them, as recorded in Burnet's *Reformation*, vol. i. pt. ii. record xxi.

Stillington has shown that there is no Catholic tradition for *seven* sacraments, that this number was not acknowledged for many centuries before the Council of Trent, and disproves Bellarmine's bold assertions. P. Lombard is the first writer who fixes on seven as the number of the sacraments. Concerning the agreement of the Greek Church in the number seven, which Bellarmine and De la Hogue (*De Sacramentis*, p. 7-8) appeal to, as proving the antiquity of this determinate number of seven, it is very summarily disposed of. 1st,—There was no such consent even among the Latin fathers, and the Greek fathers who are quoted are very *late*. For more on the number of sacraments, see Hooker, b. v. sec. 57, and the writers on our Articles.

We proceed now to consider the two sacraments, Baptism and the Supper of the Lord.

Baptism.—As the subject of baptism has already been treated of at some length (*Miscel. Div. vol. ii.* article BAPTISM and BAPTISTS), we have here chiefly to supply what is wanting in that article.

It will be seen from that article that baptism was not a new ceremony, but had been long familiar to the minds of the Jews as an initiatory rite. This very circumstance may serve to account in some degree for the little detail with which it is spoken of in Scripture, and for the omission of some of those particulars at which men have occasionally stumbled in modern days. Thus, the baptism of infants is not specified as being a thing then understood and implied. But as this holy rite is of the utmost importance, as being that whereby we are brought into covenant with God, and made members of Christ's Church,—as it is that to which the holy Church attributes the heavenly grace of regeneration,—it will be requisite to show some of the grounds on which the baptism of infants has been most justly retained in our Church.

It has been said that the Church of England is obliged to call in tradition to defend infant baptism, because it cannot be proved by Scripture. This assertion is by no means just; but were it so, infant baptism is a *custom*, not a *doctrine*, and the *practice* of the Church is the best means which we have of ascertaining in what sense she understood the commands of Scripture. But we can show for the custom such warrant from Scripture that we should fear, if we ever gave it up, that we were abandoning a plain commandment of our Saviour. We shall, therefore, in the very brief defence of it which we shall here make, first adduce some passages from Scripture, and then state what Christian antiquity enables us to infer.

In the first place, however, we must request attention to the baptism of proselytes, as practised by the ancient Jews.* It is known that the existing children of proselytes were baptized, however tender their age. Those born after the parents' reception into the Jewish Church were treated as children of Jews; the males

* See the Introduction to Wall's *History of Infant Baptism*, abridged in *Ency. Met. Misc. Div.* article BAPTISM.

Theology. were circumcised, and a sacrifice was offered for the females; as is proved at large in Wall's *History of Infant Baptism*.

This being the case when baptism was enjoined, we should not expect any particular specification of infants as capable of baptism, because by the custom of those days when baptism was spoken of this was implied. Let us now attempt to ascertain the doctrine of Scripture and the practice of antiquity on this point.

1. *Scripture*.—The rite of circumcision at once prepares us to admit that infants are capable of being received into covenant with God. Nor does it make much difference that the one is an outward ceremony and a less spiritual covenant. We learn from St. Paul, *Rom. ii. 28, 29*, that circumcision was a sign of a spiritual covenant also.

Let us then apply these two facts to the explanation of our Lord's command to his apostles,—“*Go ye therefore and teach all nations, baptizing them in the name of the Father, and of the Son, and of the Holy Ghost*,” *Mat. xxviii. 19*; observing that the word (*μαθητεύσατε*) translated ‘*teach*,’ more properly means ‘*disciple*,’ or ‘*make disciples of*,’ which is much the same as ‘*making proselytes*.’ Had the command been ‘*make disciples of all nations, circumcising them*,’ could there have been a doubt that infants would have been included in this command? Considering that the infants of proselytes were also usually baptized, can we think that anything else was intended or understood by the command, as it stands, than that infants as well as adults should be baptized. The proof rather lies on those of the opposite opinion. It being usual to baptize infants, if our Saviour had intended to exclude them, he would have specified it.*

Dr. Gale† labours very hard to prove that *μαθητεύσατε* must mean *teach*, and not ‘*disciple*,’ but is not very successful in his observations on Wall; who, in his *Defence of the History of Infant Baptism*, has replied to them.

Again, our Saviour says, *John iii. 15*, *Except a man be born of water and of the Spirit, he cannot enter into the kingdom of God*; from which the necessity of baptism for all may be inferred. The Greek word is *τις*. The antipædo-baptists endeavour to wrest this text from us by arguing that infants are not capable of the grace of the Holy Spirit, and therefore cannot have this saving baptism, but are saved without baptism. Of some of the graces of the Holy Spirit we may suppose them

incapable, but of the precise nature and mode of the operations of God's Spirit on the heart we are so profoundly ignorant that we can draw no conclusion from such a statement. (See Wall and Bishop Bethell.) Again, our Lord (*Mark x. 14*) says, “*Suffer the little children to come unto me, and forbid them not, for of such is the kingdom of God*.” This passage needs only to be combined with the last cited to show how strong a testimony it gives to these deductions from Scripture.

With regard to the expression, “*he and all his*,” used of the gaoler who was baptized at Philippi, and the “*household of Lydia*,” who were baptized with her, it is perhaps unwise to rest much on such passages (*Acts xvi. 15, 38*; *xi. 14*). In *Acts viii. 12*, only men and women are mentioned.

Lastly, we may refer to *1 Cor. vi. 14*, the sense of which (*holy and saints* being often used for *baptized persons*) would be paraphrased thus,—

“*For it has often come to pass that an unbelieving husband has been brought to the faith, and so to baptism, by his wife, and vice versa; if it were not so, and if the wickedness of the infidel (whether wife or husband) prevailed, their children would be kept unbaptized, and so be unclean; but we see the contrary, for they are generally baptized, and so become holy or sanctified.*”

For a defence of this interpretation, which coincides with that of Gregory of Nazianzum, St. Augustine, and Pelagius, we must refer to Wall's *History of Infant Baptism*, pt. 1, chaps. xi. xv. xviii.

2. *The Practice of Antiquity*.—In arguing the question of infant baptism from the practice of antiquity, we must observe that those passages by *inference* support our views which maintain the doctrine of original sin, and the absolute necessity of baptism to salvation. An infant, who is liable to condemnation on account of original sin, clearly requires baptism to obtain remission of that sin; and if baptism is unconditionally necessary for salvation, it must be necessary for infants as well as others. The passages adduced from Clement of Rome maintain the doctrine of original sin, and state that it affects even a child who lives but one day.

There is a passage also in the Pastor of Hermas which makes for infant baptism, but it requires too long an examination to be adduced here; it will be found well discussed both in Wall and Bingham. The passages which are of most importance are those from Justin Martyr, Irenæus, and Tertullian.

Justin Martyr (*Dial. cum Tryphone Judæo*) maintains the doctrine of original sin, and in the same dialogue makes baptism correspond to circumcision. He also speaks of persons 60 and 70 years of age, who had been made disciples to Christ from their childhood (*οἱ ἐκ παιδῶν ἐμαθητεύθησαν τῷ χριστῷ*); their being “*discipled*” would have been within a few years after the writing of St. Matthew's gospel, and they were made so “*from their childhood*!” So that this shows the practice of the *Apostolic* age.

The following extract from Bingham's *Antiquities of the Christian Church*, b. xi. ch. iv. § 9 and 10, will give us the substance of what is to be gathered from Irenæus and Tertullian.

“*Not long after the time of Justin Martyr and the author last mentioned*” (the author of the *Recognitions*, falsely ascribed to Clemens Romanus), “*lived Irenæus, bishop of Lyons, who, as Mr. Dodwell evidently shows,*

* See Wall; and Lightfoot, *Harmony of the Gospels*, and *Hor. Heb.*, *Matt. iii. 6*. The late Mr. Coleridge, in his valuable work entitled *Aids to Spiritual Reflection*, p. 358—378, while arguing for the practice of infant baptism, yet denies that there is any sufficient proof that it was in use in the age of the Apostles. He does not allude to the above passage, and seems to assume (p. 359) that the baptism of infants cannot be shown to be a known practice of that age; but takes no notice of the argument from the baptism of infant children of proselytes. But he afterwards contends most earnestly (p. 361) that nothing conclusive against the practice can be drawn from the silence of the Apostles; and he declares, in a note (p. 363), that the assertions of Robinson, in his *History of Baptism*, that *infant baptism did not commence till the time of Cyprian, &c.*, are rash, and not only unwarranted by the authorities he cites, but *unanswerably confuted* by the arguments of Wall and others. He does not deny that it was the practice of the Apostles; he only denies that we have sufficient proof of it. Mr. Coleridge, however, in both cases, only gives the conclusions at which he has arrived; with one exception, he answers no argument derived from Scripture.

† Gale's *Reflections on Wall's History of Infant Baptism*, letter vii. p. 244—289.

Theology. and Mr. Cave from him, was born in the latter end of the 1st Century, about the year 97, and was a disciple of Polycarp, who was a disciple of St. John. About the year 176 he wrote his book against heresies, being then about 80 years old, and died not many years after. So that he must needs be a competent witness of the Church's sense and practice upon this point during the IInd Century. Now there are three things related on this matter, which appear very evident from him: (1) that the Church then believed the doctrine of original sin; (2) that the ordinary means of purging away this sin was baptism; (3) that children as well as others were then actually baptized to obtain remission of sins, and apply the redemption of Christ to them. For the doctrine of original sin he sometimes calls it the sin of our first parents,* which was done away in Christ by his loosing the bonds wherein we were held and bound over unto death; the sin whereby we offended God† in the first Adam by disobeying his commands, but were reconciled to God in the second Adam by obedience unto death. So that infants as well as others were under the guilt of this sin, and had need of a redeemer, with the rest of mankind, to deliver them from it. Now the ordinary way of being freed from this original guilt, he says, is baptism, which is our regeneration‡ or new birth unto God. And this he expressly affirms to be administered to children as well as adult persons. 'For,' says he, 'Christ § came to save all persons by himself; all, I say, who by him are regenerated unto God, infants and little ones, and children, and youths, and elder persons. Therefore he went through the several ages, being made an infant for infants, that he might sanctify infants; and for little ones he was made a little one, to sanctify them of that age also.' No art can elude this passage, so long as it is owned that regeneration means baptism. And for this, we have the explication of Irenæus himself, who calls baptism by the name of regeneration; and so all the ancients commonly do, as Suicerus (against whom I am now disputing) scruples not to own, alleging Justin Martyr,|| Chrysostom, and Gregory Nyssen to this purpose; which fully evinces infant baptism in the age of Irenæus, that is, in the IInd Century, to have been the common practice of the Church.

"In the latter end of the IInd Century, and beginning of the IIIrd, lived Tertullian, presbyter of the Church of Carthage; who, though he had some singular notions about this matter, yet he sufficiently testifies the Church's practice. In his own private opinion he was for deferring the baptism of infants, especially where there was no danger of death, till they came to years of discretion; but he so argues for this, as to show us that the practice of the Church was otherwise. 'For,' says he, 'according to every one's condition¶ and disposition, and also their age, the delaying of baptism is more advantageous, especially in the case of little children. For what need is there that the godfathers should be brought into danger? because they may either fail of their promises by death, or they may be deceived by a child's proving of wicked disposition. Our Lord says, indeed, 'Do not forbid them to come unto me.' Let them come, therefore, when they are grown up; let them come when they can learn; when they can be

taught whither it is they come; let them be made Christians when they can know Christ. What need Theology. their innocent age make such haste to the forgiveness of sins? Men proceed more cautiously in worldly things; and he that is not trusted with earthly goods, shall he be trusted with divine? Let them know how to ask salvation, that you may appear to give it to one that asketh. For no less reason unmarried persons ought to be delayed, because they are exposed to temptations, as well virgins that are come to maturity as those that are in widowhood by the loss of a consort, until they either marry or be confirmed in continence.' The way of Tertullian's arguing upon this point shows plainly he was for introducing a new practice; that therefore it was the custom of the Church in his time to give baptism to infants as well adult persons; and his arguments tend not only to exclude infants, but all persons that are unmarried or in widowhood, for fear of temptation; which are rules that no one beside himself ever thought of, much less were they confirmed by any Church's practice. But even this advice of Tertullian, so singular as it was, seems only calculated for cases where there was no danger or apprehension of death; for otherwise he pleads as much for the necessity of baptism as any other, both from those words of our Saviour,* 'Except one be born again of water and the Spirit, he cannot enter into the kingdom of heaven;' as also from the general corruption of original sin, which renders every son of Adam unclean till he be made a Christian, which is only done in baptism; for men are not born Christians, but made so: and therefore, in case of necessity, he thought every Christian had power to give baptism rather than any person should die without it; which seems to imply that his opinion for delaying baptism, whether of infants or others, respected only such cases where there was no danger of death; but even in those cases the practice of the Church was otherwise; for she baptized infants as soon as they were born, though without any imminent danger of death, as appears from Tertullian's discourse itself, who laboured to make an innovation, but without any success; for the same practice continued in the Church in the following ages."

The above arguments and extracts will be sufficient, we trust, to prove that infant baptism was the practice of the early Church, and to explain the course which Scripture takes concerning this great question. They are to be considered, not as a full exposition of the views of the Church in regard to baptism, but as supplementary to the article to which we have above referred. (*Ency. Met. Misc. Div.*, article BAPTISM and BAPTISTS.) We now proceed to the other Sacrament of the Christian Church—the Supper of the Lord.

It will be observed that we have not here entered at all into the question of regeneration, as connected with baptism. There can be no doubt, from the offices of the Church of England, that she considers baptism to be the means by which the grace of regeneration is received; and this, we humbly conceive, is the true sense of Scripture. But to engage in the discussion of this point would carry us far beyond the limits to which we are necessarily confined. Some who differ widely on the subject will probably find that their difference chiefly arises from a difference in their definition of the term Regeneration. The following extracts from Bishop Bethell's very valuable work, entitled *A General View of the Doctrine of Regeneration in Baptism* (2nd edit. 1836), will, however, be acceptable to most readers.

* Irenæus, lib. v. c. 19. † Id. v. 16. ‡ Id. i. 18.
§ Id. ii. 39. || Suicer. *Thesaur. Eccles.* voc. 'Αναγεννησις.
¶ Tertull. *De Baptismo*, c. 18.

* Tertullian, *De Anima*, c. 40; *De Baptismo*, c. 13.

Theology.

In that book, Bishop Bethell observes, in speaking of the word Regeneration,—“No reasonable doubt can be entertained that it was appropriated to that grace, whatever may be its nature, which is bestowed upon us in the sacrament of baptism (including, perhaps, occasionally, by a common figure of speech, its proper and legitimate effects, considered in conjunction with it), from the beginning of Christianity to no very distant period of ecclesiastical history. In those few passages of the ancient Christian writers where it evidently bears another signification, it is evidently used in a figurative manner, to express such a change as seemed to bear some analogy in magnitude and importance to the change effected in baptism. At the time of the Reformation the word was commonly used in a more loose and popular way, to signify sometimes justification, sometimes conversion, or the turning from sinful courses, sometimes repentance, or that gradual change of heart which is likewise styled renovation. Hence, in popular language, it came to signify a great and general reformation of habits and character, and the words ‘regenerate’ and ‘unregenerate’ were substituted for the words converted and unconverted, renewed and unrenewed, righteous and wicked. But in the hands of the systematic Calvinists, the word passed from the popular to a strict and determinate meaning; and they pronounced regeneration to be an infusion of a habit of grace, or a radical change of all the parts and faculties of the soul, taking place at the moment of the effectual call. From hence the transition to a sensible change was easy and natural; and what was a theological speculation in the system of the scholastic divines, became, in the hands of less subdued and less calculating spirits, the stronghold of enthusiasm.”—Bishop Bethell, *On Baptismal Regeneration*, p. 6-8.

The facts stated in this extract might suggest to those persons who have actually wished to alter the baptismal office of our ritual, because they cannot reconcile it with their notions of regeneration, whether it would not be wiser and more modest to reform their own ecclesiastical vocabulary, than to lay rash hands on aught so holy as our *Book of Common Prayer*. The reference to Bishop Bethell’s book supersedes the necessity for more numerous references, as the most valuable writers will be found quoted by him. Bishop Pearson, *On the Creed*, art. x., and Hooker, book v. § 59, *et seq.*, ought not, however, to be omitted.

We must add one more extract from the same volume:—

“But the truth* is, that the doctrine of baptismal regeneration, or salvation, though it has been called in question by those Protestant Churches (usually called the Reformed Churches) which have adopted the sentiments of Zuinglius and Calvin, and their off-shoots, the Arminians and Socinians, is the doctrine not of the Church of Rome only, and of all the Eastern Churches, but of the Protestant Lutheran Churches, and the Protestant Church of England and Ireland. In common with the Church of Rome and the Lutheran Churches, we hold that regeneration, or the new birth, is the spiritual grace of baptism conveyed over to the soul in the due administration of that sacrament. We hold, in common with those churches, that in adults, duly qualified by repentance and faith, the guilt of sin, both original and actual, is cancelled in baptism; that in infants, who have committed no actual or wilful sin, and can possess no such qualifications, the guilt of original sin is done away; and that infants, no less than adults, are made, in baptism, children of God, members of Christ, inheritors of the kingdom of Heaven, and partakers of the privileges, and blessings, and promises of the Gospel covenant. But the Church of Rome contends,† that not only the guilt, but the very essence and being of original sin, is removed by baptism; the Church of England declares that this ‘corruption of nature remains even in the regenerate.’ The Church of Rome has decreed that that ‘concupiscence [or fuel (*fomes*), as it is called] which remains after baptism has not, properly speaking, the nature of sin;’ whereas we affirm that ‘concupiscence has the nature of sin,’ and allege the authority of an apostle in support of our opinion. We believe that sacraments are not only signs of grace, but means or instruments through which God consigns over to the soul the grace which they signify. The followers of Zuinglius and Calvin, with whom the author of this pamphlet agrees, contend that this is the very error of the *opus operatum*—the opinion, that is—that where there is no positive bar, sacraments produce a saving effect without suitable affections on the

* This passage is in reply to the statement of an anonymous author of a pamphlet, who says that “transubstantiation and baptismal salvation,” which he classes together as branches of the same corrupt doctrine, are “the two great subjects of dispute between Protestants and [Roman] Catholics.”

† See the *Canones et Decreta Concil. Trident.* sessio v.; and the *Cat. Concil. Trident.* pars ii. ch. ii. 43.

Theology. part of the recipient. We, however, affirm, as a general truth, that such affections of mind are indispensable, and that where they are wanting, sacraments produce no beneficial effects. But as we are convinced that the baptism of infants is a part of our Saviour’s institution, we do not conceive that, in their case, the unavoidable want of these qualifications is any impediment to the saving grace of the sacrament.”—Bishop Bethell, Preface, p. xvii.-xix.

The question of *lay-baptism* has already been treated of, under the article BAPTISM, in Vol. I. of the Miscellaneous Division of this *Encyclopædia*. We may just add, that the non-jurors generally considered lay-baptism invalid; and that Dr. Bingham, the learned author of the *Antiquities of the Christian Church*, wrote a defence of lay-baptism, which he entitled, *A Scholastical History of Lay-baptism*, to which we must further refer those who wish to investigate this point, as well as to the *Lay-baptism Invalid* of Mr. Lawrence, with whom Bingham was in controversy on this point. Bingham maintained that in the primitive Church the rule was, that laymen were not permitted to baptize in ordinary cases; but when a case of necessity arose, that their baptism was considered valid. The Roman Catholic Church goes far beyond this,—allowing *Jews, Turks, and Pagans* to baptize in cases of necessity (see the *Rituale Romanorum*, tit. *De Baptismo Ministro*).

The ecclesiastical courts of this country have laid it down that the baptism of dissenters is sufficient for the purpose of entitling a person to burial (*Kemp v. Wickes*, and more recently *Escott v. Mastin*); but they suppose the baptism administered in the name of the Holy Trinity. The decision is one much controverted. The case has not yet been tried of an Unitarian baptism in the name of Jesus Christ only.

The Sacrament of the Lord’s Supper.

The account of the institution of the Sacrament of The Eucharist, as recorded in the most solemn and affecting simplicity of the Evangelists, and repeated in the independent testimony of St. Paul, must be familiar to the mind and heart of every Christian. It is impossible for any one who has a reverential spirit to meditate on these passages of Scripture without feeling the extreme solemnity of the season chosen by our Lord for the institution of this Holy Sacrament. Without presuming to search out the motives which induced our Lord, in his infinite wisdom and mercy, to select this most affecting season for this purpose, we may nevertheless observe, that it is admirably calculated to subdue all irreverence of speculation on this mysterious rite, and to lead us to connect its celebration most clearly and closely with the atoning Sacrifice of which it is the commemoration. It is, indeed, a subject on which the reverential believer would desire to speak only in the tones of gratitude, of faith, and of love. But, unhappily, such appalling errors have been maintained with respect to it, and have led to such grievous superstitions, that it is impossible to treat even of this soul-subduing subject without entering upon controversial discussions, if we desire that the simple truth, as propounded to us in the Word of God, and as received by the primitive Church, may be maintained.

Article xxxviii. of the Church of England declares that—

“The Supper of the Lord is not only a sign of the love that Christians ought to have among themselves one to another, but rather is a sacrament of our redemption by Christ’s death, insomuch that to such as rightly, worthily, and with faith receive the same, the bread which we break is a partaking of the Body of Christ, and likewise the Cup of Blessing is a partaking of the Blood of Christ.

“Transubstantiation (or the change of the substance of bread and wine) in the Supper of the Lord cannot be proved by Holy Writ; but is repugnant to the plain words of Scripture, overthroweth the nature of a sacrament and hath given rise to many superstitions.

Theology.

"The Body of Christ is given, taken, and eaten in the Supper, only after an heavenly and spiritual manner. And the mean whereby the Body of Christ is received and eaten in the Supper, is Faith.

"The Sacrament of the Lord's Supper was not by Christ's ordinance reserved, carried about, lifted up, or worshipped."

The Romish doctrine.

The Romish doctrine of Transubstantiation is plainly expressed by the Council of Trent, in its 13th session. It is there stated that the Church has always maintained that *per conversionem panis et vini conversionem fieri totius substantiæ panis in substantiam corporis Christi Domini nostri, et totius substantia vini in substantiam sanguinis sui*; and it is added, that this change of substance has properly been called Transubstantiation by the Church. It is, therefore, the doctrine of the Romish Church that the accidents of bread and wine remain, but not its substance.

It will be seen at once that this is a doctrine of immense importance; and it is a matter of notoriety that the very consequences which might naturally be expected to flow from an admission of its truth, have been pushed by the Church of Rome to their fullest extent.

In that Church the consecrated wafer,* being considered to be changed into the very substance of Christ's Body, is ordered to be adored with the same reverence as that with which the Deity himself is worshipped. (*Concil. Trident. sess. xiii. cap. v. and canon vi.; and Catechism. ad Parochos, pt. ii.; De Euchar. Sacram. viii.*)

The oblation of this sacrament is also by that Church considered a propitiatory sacrifice, available not only for those who partake of it, but for others also, whether living or dead, to obtain remission of sins and other benefits of Christ's passion,—his sacrifice being thus, as it were, repeated.

These two consequences, which have flowed from the admission of this doctrine of transubstantiation, attest its great importance, and would at once suggest to any thoughtful mind the necessity of extreme care and caution before he would accept it. If it be not true, the first of these must be an act of idolatry, and the second a delusion. The chief Scriptural authority on which our faith in this doctrine is challenged by its advocates, is the passage of Scripture in which our Lord says, "This is my body,"—an expression which the Romanist understands *literally*, and the Protestant *figuratively*.

Extreme Protestant view.

There is, besides this extreme, into which the Church of Rome has fallen, another also, of an opposite character. This sacrament is by some conceived to be a *mere commemorative rite*,—a doctrine which is as far from reaching to the truth of the matter, as laid down in Scripture, as the doctrine of transubstantiation goes beyond it.

The Church of England holds a middle course.

Between these two extremes the Church of England has held a middle course, not defining the mode by which the faithful receiver of the holy symbols becomes a partaker of the body and blood of Christ, but absolutely denying the gross and carnal mode in which the Church of Rome has defined it; and at the same time,

* The words *sacramentum* and *Eucharistia* are used in the canons and decrees of the Council of Trent for the wafer, as some passages absolutely require this interpretation: *e. g.* sess. xiii. cap. vi. (See the *Catechismus ad Parochos*, pt. ii., *De Euch. Sacram. viii.*)

by adhering to Scripture truth and primitive belief, securing this Holy Sacrament from every degree of irreverence.

The Church of England (in her *Catechism*, and in Art. xxviii.) acknowledges that the Body and Blood of Christ are verily and indeed taken and received by the faithful in the Lord's Supper; but at the same time declares that it is taken and received only after a heavenly and spiritual manner.* The Church of England, with the primitive Church, gladly acknowledges, that after Consecration the bread and wine are no longer common bread and wine; that though their substance remains unchanged, yet that they are changed *in their property as in their use*; that from being mere food for the body, they become *sacramentally* the Body and Blood of our Saviour to the soul, as being in their use ordained means by which the faithful believer becomes a partaker of the benefits of Christ's body and blood, and by which he is made one with Christ, and Christ with him. As long as we keep to language like this, we maintain nothing but what Scripture sanctions, and the primitive Church received.

Obs.—It will be observed, that while our authorized formularies only so far define the mode in which the Body of Christ is received in Sacrament, that they assert it to be received only after a spiritual and heavenly manner, they do not use the term "*real presence*." This phrase is, however, used by the great writers of our Church, who have expressly treated of these points, *e. g.* Andrewes, Jeremy Taylor, Wake, &c. And the great truth expressed in the authorized formularies is equally strong in asserting the mystery of the Sacrament; but it may be worth considering whether the use of the term *presence* introduces any difficulty which is avoided by the other mode of expression. When used in its proper sense, the term "*real presence*" is only tantamount to the expressions of the authorized formularies of our Church; and the great primitive truth and mystery is asserted by both modes of expression. But without venturing, in a matter of so great depth, to object to a course followed by so great men as those we have referred to, and others of as noble name in our Church, we may, with reverence, examine the effect which the introduction of the term may possibly have, and inquire humbly and modestly still, whether it has a tendency to *define* the mysterious truth involved in our sacramental doctrine, or even to advance a step towards *defining* it. Without asserting that it does so, we still think that it is a question deserving of consideration; if it does, we ought at least to be aware of it, whatever course we take; if it does not, then the phrase is cleared from all objection.†

The sacred symbols are, therefore, more than common bread and wine after consecration; not by any change in their substance, but by a change in their properties and use. *How* they are the means of conveying the benefits of the passion of Christ to us, we presume not to inquire. It is enough for us to believe, as St. Paul has expressed it, in 1 Cor. x. 16—"The cup of blessing which we bless, is it not the communion of the

* On the subject of the Sacrament we may refer to the following works by English divines, which we have found, among many others, very useful:—Moreton, *On the Mass*; White's *Conference with Fisher*; Laud's *Conference with Fisher*; Wake, *On the Eucharist*; Waterland, *On the Eucharist*; Cosins, *Historica Transubstantiationis*; Usher's *Answer to a Jesuit's Challenge*; and Turton's *Answer to Wiseman*. In Bellarmine's controversial works will be found the chief arguments used by the Roman Catholics. The work of Arnauld and Nicole, *La Perpétuité de la Foi*, is also an elaborate work to prove the primitive doctrines the same as the present Roman Catholic; a view to which the works above cited will give a sufficient contradiction. See, against this, Albertinus, *De Eucharistia*, and L'Arroque, *Histoire de l'Eucharistie*.

† We may observe that Archbishop Wake says that "our Church utterly denies our Saviour's body to be *so really present* in the Blessed Sacrament as to leave Heaven, or to exist in *several places at the same time*;" and Bishop Taylor says, "By spiritually, they (the Papists) mean, present after the manner of a spirit; by *spiritually* we mean, present to our spirits only."

Theology. blood of Christ? The bread which we break, is it not the communion of the body of Christ?"

Our Church, in her xxviiith Article, asserts that transubstantiation is repugnant to the plain language of Scripture; and we proceed, therefore, to compare that doctrine with Scripture, and with the faith of the early Church.

1. *Scripture.*—The declaration of our Lord, "Take eat, this is my body," we contend, against the Romanists, in the account of the institution of the Lord's Supper, must be considered as figurative, just as the language of Scripture is found to be in many analogous cases. Let us take the phrase, "that Rock was Christ," 1 Cor. x. 4;—will it be contended that this was not figurative language? Again, look at our Lord's own language, on the same evening as that on which he instituted this sacrament, "I am the true vine." Is it possible to take this in any other than a figurative sense?

These are instances of figurative language which suggest at once to us the propriety of receiving the above declaration of our Lord in a figurative sense also. There are other circumstances also connected with the occasion, viz., the paschal feast, on which our Saviour made this declaration, which strengthen the argument for its figurative sense.* The language of the Jews at that solemn season was of a similar nature with our Lord's words. The master of the house was accustomed to take bread, break it, and give it to the guests, saying, *This is the bread of affliction which our fathers ate in Egypt*; and the paschal lamb they called the *body of the Passover*. Again, the master of the house blessed the cup, gave thanks, and then delivered it to the rest saying, *This is the fruit of the vine, and the blood of the grape*; and we cannot but suppose that our Lord made his declarations with a tacit reference to these customs.†

Archbishop Wake further observes, in reference to this passage of Scripture:

"It is the acknowledgment of their greatest writers" (*i. e.* the Romanists) "at this day,‡ that if the pronoun *this*, in that proposition, '*This is my body*,' be referred to the bread which our Saviour held in his hand, which he blessed, which he brake, and gave to his disciples, and of which, therefore, certainly, if of anything, he said '*This is my body*,' the natural repugnancy that there is between the two things affirmed of one another, bread and Christ's body, will force them to be taken in a figurative interpretation; forasmuch as 'tis impossible that bread should be Christ's body otherwise than by a figure. And, however, to avoid so dangerous a consequence, they will rather apply it to anything, nay, to nothing at all, than to the bread; yet they would do

* See Archbishop Wake, *On the Eucharist*, Introduction, p. 3., who quotes authorities for this statement.

† For further illustrations we must refer to Archbishop Wake, *ubi supra*.

‡ The Archbishop places the following note in the margin of this passage: "See Bellarmine's words in the *Defence of the Exposition of the Doctrines of the Church of England*, pp. 56, 57. To which may be added Salmer, tom. ix. tr. 20; Suarez, *Disput.* 58, § 7; Vasquez, *Disput.* 201, c. 1, &c."

In Bellarmine's controversial works, tom. iii., will be found his four books *De Sacramento Eucharistiae*, in the first of which (chapters 10 and 11) is found his discussion of the words *Hoc est corpus meum*. We think few readers could peruse this portion of the treatise without observing the great ingenuity of the Cardinal, and, at the same time, the very unsatisfactory nature of his arguments.

Theology. well to consider whether they do not thereby fall into as great a danger on the other side; since, if the *relative* *this* do's not determine these words to the bread, 'tis evident that nothing in that whole proposition do's; and then, how those words shall work so great a change in a *subject* to which they have no manner of relation, will, I believe, be as difficult to show as the change itself is incomprehensible to conceive." (Wake, *On the Eucharist*, p. 20.)

These considerations, to which many more might be added (as, indeed, many more are, in the very treatise just quoted), will, we trust, be sufficient to support the statement of Article xxviii. of our Church, with regard to the language of Scripture. We proceed now to compare transubstantiation with the faith of the early Church.

Among the Roman Catholics, the Jansenists maintain that the sixth chapter of St. John's Gospel is *not* to be understood of the Sacrament of the Lord's Supper. Others maintain that it is to be referred to this subject. The latest attempt which has been made to support transubstantiation by that portion of Scripture is to be found in Dr. Wiseman's *Lectures on the Eucharist*, which have been so ably answered by Dr. Turton. (See also Waterland, *On the Eucharist*, ch. vi.) Wake also has touched upon this chapter, and observes, that, with regard to v. 51, our opponents confess that the two first assertions in it are to be taken figuratively, but insist, at the same time, on taking the third literally.

There is no question that the Fathers occasionally use language, in speaking of the Sacrament, which is by no means inconsistent with transubstantiation, and which might seem apparently to favour it, because they speak of a change in the elements, and of the bread and wine as the body and blood of Christ. But the quotations of this sort are usually more than neutralized by other passages from the same Fathers, declaring the nature of this change, and precluding the notion of any change of substance.

And besides, the very passages themselves, which are adduced to support transubstantiation, will, in fact, be found to fall far short of this object.* They amount, in general, to a declaration that the bread and wine are no longer, after consecration, mere bread and wine, but that they are the body and blood of Christ; but indications sufficiently strong are given to show that this implied no change in the substance of the sacramental elements, but a change in their use and destination; while expressions are used which also show that the gross and carnal understanding of such passages would be highly abhorrent from the views and notions of the authors themselves.

There is a very remarkable passage in a fragment of Irenæus, which Dr. Waterland has referred to. The fragment itself is found in Massuet's *Irenæus*, p. 343, and is to this effect:—The slaves of some Christians having been seized, were put to the torture, to make them bring some accusation against their masters, from the nature of their mysteries; and these slaves [ὅτι ἔχοντες πῶς τὸ τοῖς ἀναγκάζουσι καὶ ἡδονὴν ἔχειν, παρὰ τὸν ἥκουον τῶν δι-σποτῶν, τὴν θέλαν μεταλλάξιν αἶμα καὶ σῶμα εἶναι Χριστοῦ αὐτοὶ νομίσαντες τῷ ὄντι αἶμα καὶ σαρκὰ εἶναι, τοῦτο ἐξῆπτον τοῖς ἐκζητοῦσιν], not being able to gratify those who made this search, inasmuch as they

Cardinal Bellarmine observes, that *hoc* can neither mean this bread nor the body of Christ, but that which is contained under the accidents of the bread. *Hoc non demonstrat panem, nec corpus Christi, sed contentum sub speciebus.* (lib. i. *De Sacr. Euch.* c. xi.) In another passage (c. x.) he observes, that if our Lord spoke of the bread, it would be absurd to say, *Hoc est corpus meum, cum debuisset dicere, Hic panis est corpus meum.* The language concerning the cup seems plainly, by analogy, to point out the bread as the *subject* of this proposition; and the very text which the Cardinal requires, is supplied by St. Paul, who says, "As often as ye eat this bread," &c.

* We observe that Cardinal Perron gives up the treatise of St. Athanasius, usually quoted for this purpose, as being spurious.

Theology.

heard from their masters that the divine communion was the body and blood of Christ, *thinking that it was in reality flesh and blood*, told this to the inquisitors. On which Blandina, one of the Christians tortured on this accusation, replied most nobly and freely, by saying, *How could those bear such a thing, whose discipline restrains them from enjoying even the flesh which is permitted?* [πῶς ἂν ὑποῦσα, τούτων ἀνάσχοιτο οἱ μηδὲ τῶν ἐφικμένων κρεῖων δι' ἄσκησιν ἀπολαύοντις;]*

St. Cyril of Jerusalem.

Let us now proceed to quote one of the most remarkable and strongest passages usually adduced in favour of Transubstantiation, and see to what it amounts. This is the celebrated passage of St. Cyril of Jerusalem, in his fourth catechetical lecture on the Mysteries (*Cat. Mystog.* iv. 3), beginning thus, ὥστε μετα πάσης πληροφορίας, ὡς σώματος καὶ αἵματος, &c. The whole passage runs thus:—

“Therefore, with full assurance of faith, let us partake, as of the body and blood of Christ, for in the symbol (τύπῳ) of bread the body is given to thee, and in the symbol (τύπῳ) of wine the blood is given to thee, that thou, partaking of the body and blood of Christ, mayest be (σύσσωμος καὶ σύναιμος αὐτῷ) of the same body and blood with Christ. For thus we become *Christophori*, his body and blood being distributed into our members, and thus also, according to St. Peter, we become partakers of the Divine nature.”

We here observe that *τύπος* is used—not *εἶδος*. St. Cyril afterwards desires us not to trust our own taste, but to believe the word of Christ; but the words which follow the passage just cited sufficiently explain how they are to be understood. St. Cyril immediately adds a caution, lest we should take this passage too literally. He adds, “Christ, once in conversation with the Jews, said, ‘Unless ye eat my body and drink my blood, ye have not life in yourselves;’ and they, not understanding† spiritually what was said, being scandalized [at it], went away back, thinking that he was inciting them to the eating of flesh (*σαρκοφαγία*).” Here St. Cyril evidently blames the Jews for not understanding our Lord’s words in a spiritual sense, which is a strong argument that he both understood our Lord’s words, and used the same himself, in regard to the Eucharist, in a spiritual, not a carnal sense.

St. Augustine.

In the same manner, very strong language is used by St. Augustine, in some instances, relative to the Eucharist. But if we look at a passage in his *Enarratio in Ps. XCVIII.*, we shall find a plain intimation of the manner in which he used such language, and would have it to be understood: “*Non hoc corpus quod videtis manducaturi estis, nec bibituri illum sanguinem quem fusuri sunt, qui me crucifigent; Sacramentum aliquod vobis commendavi, spiritualiter intellectum vivificabit vos.*”

St. Chrysostom and others.

In the same manner the passages which Romanists may adduce from St. Chrysostom may be met with others, by which it is clear that he spoke of these things spiritually, and not carnally, and that he understood that the body and blood of our Saviour were

spiritually, though really, received in the Eucharist. Theology. For these passages we may refer to Bishop Cosins, *Histor. Transubstantiationis*, ch. v. s. 18, pp. 73, 74.

And in the same manner also the language used by other fathers of the Church, which appears sometimes to approach this doctrine, is explained by passages which show us that the words there used must be interpreted spiritually.

It may perhaps be well to state, that those who wish to pursue the subject to a greater extent will find great advantage from the works already quoted, especially the *Historia Transubstantiationis*, by Bishop Cosins, and the treatise of Archbishop Wake. They will be able there to test the above assertion with regard to the fathers, and they will find the classification of passages on this point suggested by Bishop Cosins, in chap. vi. s. 5, of considerable use. Let them compare also the following statement of Archbishop Wake:—

“For the expressions of the Holy Fathers; it is not deny’d but that in their popular discourses they have spared no words* (except that of *Transubstantiation*, which not one of them ever used,) to set off so great a mystery; and I believe that, were the *Sermons* and *Devotional Treatises* of our own Divines alone, since the *Reformation*, searcht into, one might find expressions among them as much overstrained.† And doubtless there would be as strong an argument to prove *Transubstantiation* now the doctrine of the Church of England, as those to argue it to have been the opinion of those primitive ages.”

“But now let us consult these men in their more exact compositions, when they come to teach, and not to declaim, and we shall find they will then tell us—that these elements are, for their‡ *substance*, what they were before, bread and wine; that they retain the true *properties* of their nature, to *nourish* and *feed* the body; that they are things *inanimate* and void of *sense*; that, with reference to the Holy Sacrament, they are *images, figures, signs, symbols, memorials, types* and *antitypes* of the body and blood of Christ; that, in their *use* and *benefit*, they are indeed the very *body* and *blood* of Christ to every faithful receiver, but in a *spiritual* and *heavenly* manner, as we confess; that, in propriety of speech, the *wicked* receive not, in this Holy Sacrament the *body* and *blood* of Christ, although they do outwardly press with their teeth the Holy Elements; but rather eat and drink the Sacrament of his *body* and *blood* to their damnation.”—Wake, *On the Eucharist*, pp. 24, 25.

We must now commend these statements to the judgment of the reader. He will find in the works already cited abundant means of ascertaining the value and justness of the results which we have here given. The line of argument by which these results are obtained has been indicated, and, as far as our limits allow, illustrated and supported by quotations. Little further appears practicable without a thorough and lengthened investigation into the whole question.

But the result to which we are now brought is unquestionably this—that the Tridentine Council has not only been unwarrantable in defining what Scripture does not enable us to define, but has erred most grievously in defining it in a manner entirely inadmis-

* “Such are μεταποίησις, μεταβολή, μεταρρύθμισις, μεταλήψις, μεταστοιχείωσις, but never μεταουσίωσις. And note, there is hardly one of these words which they have applied to the bread and wine in the Eucharist, but they have attributed the same to the water in Baptism.

† “See Treatise first, *Of the Adoration*, &c., printed lately at Oxford; which would make the world believe that we hold, I know not what imaginary *real presence* on this account; just as truly as the Fathers did Transubstantiation.”

‡ “It is not necessary to transcribe the particulars here, that have been so often and fully alleged. Most of these expressions will be found in the Treatise of *Transubstantiation* lately published” (1687). “The rest may be seen in Blondel, *Eclaircissements Familiers de la Controverse de l’Eucharistie*, cap. iv. vii. viii.; Claude, *Rep. au 2 Traité de la Perpétuité*, part. i. cap. iv. v. Forbesius, *Instructiones Historico-Theolog.* lib. xi. cap. ix.-xiii. xv.; Larroque, *Histoire de l’Eucharistie*, liv. 2, cap. ii.”

To the above authorities of the Archbishop, among which the works of Forbes will be found very valuable, may be added the

* In Euseb. v. 1, Blandina, one of the martyrs of Lyons, makes a similar reply to the accusation, that Christians ate infants at their secret meetings. But this makes no difference as to the argument from Irenæus.

† Touttée (the Benedictine editor) rebukes Mills for translating this thus: “not understanding what was spiritually said.” Touttée appears to be right as to the Greek; but it makes very little difference as to the sense of the passage. If the Jews were wrong in not understanding it spiritually, as Touttée’s own translation implies, then it was said spiritually, i. e., intended to be taken so.

Theology. sible, and opposed to the real statements of Scripture and the true views of the best ages of the Church.

We may here note some of the errors with which the doctrine of Transubstantiation has a close connexion:—

1. The adoration of the host, as remarked upon before.

2. The notion that the mass is a truly propitiatory sacrifice. We must, in speaking upon this point, be careful to define clearly what is meant by the word *propitiatory*. If it merely means *making* or *rendering propitious*, as prayer may be said to render God *propitious*, then the assertion is altogether different from that which is objected to in the Romish doctrine, which asserts that the sacrifice of the mass must be offered as a propitiatory sacrifice *pro vivis et defunctis, pro peccatis, pœnis satisfactionibus et aliis necessitatibus* (*Can. et Decret. Concil. Trid. sess. xxii. can. iii.*; compare cap. ii. of the same session); by which words we may understand that it contains a propitiatory offering capable of taking away sin. It is easy to see the abuses to which such a view must almost necessarily lead. And the imagination will not easily outstep the reality, if we inquire into the practices connected with this doctrine. See the strong language used by our Church, in Article xxxi., upon these practices.

3. The refusal of the cup to the laity. This, though not a necessary consequence of the doctrine of transubstantiation, apparently flowed from it. The argument by which this practice is supported is, that, under the bread, Christ is received fully, and it would have little meaning except as connected with transubstantiation. See Burnet on Article xxx., on the doctrine of *Concomitance*.

The Communion a sacrifice?

We must, however, before we dismiss this most important subject, observe, that although we repudiate entirely the unscriptural and unprimitive doctrine of transubstantiation, we consider the sacred elements, after consecration, more than mere signs or symbols, although they do not lose their nature of bread and wine. They are the ordained means whereby the faithful are made partakers of the body and blood of Christ, and become one with Him and He with them. And this, we trust, may prove to the Romanist, that though we reject the doctrine, which according to their notions elevates the Sacrament,* but according to ours only degrades and carnalizes it, we hold the Sacrament in no less reverence than they do; and if we can only reach to perfect purity of faith, and to a full spiritual apprehension of the mystery of this Sacrament, human language has no

work of Bishop Cosins, and that of Bishop Moreton, above referred to. A brief but convenient collection of passages is also found in Bishop Burnet, *On the Articles*, as well as a short history of the doctrine.

* This is a common argument of Roman Catholic writers. It is one which both parties ought to use only with extreme caution. Our desire ought to be, to know what God has revealed. We are sure, if we are not wanting to ourselves, to find that His way is the most calculated to secure our reverence and love. As an instance of this argument, we may cite several passages of the viii. chapter of the preface of the learned Muratori to the *Roman Sacramentary* published by him. In speaking of Bingham, he says, that he has treated all the Mass with much learning, but has left out or condemned the most excellent (*potiora*) parts of the Catholic doctrine: *Neque enim quidquam habet de incruento Missæ sacrificio; presentiam realem Corporis et Sanguinis Domini in Eucharistia, et Donorum Transubstantiationem negat, Adorationem verò debitam Christo præsentem improbat. Tolle hæc e Missa fidelium: immensa ejus dignitas mirum in modum decrescit, immo perit, &c.* The denial of the real presence is not a fair statement, and the worship that is refused and disapproved, is not worship of Christ, but of the wafer. But to let this pass, we may here mention with approbation the tone assumed by Muratori, in these passages, as being so much more moderate than that of some of his contemporaries and compatriots; e. g. *De Sala*, the editor of the magnificent edition of *Cardinal Bona de Rebus Liturgicis*, published at Turin, 1747-1753, 3 vols. folio. This book, in which one might expect the matter to be treated in a decent style, as being addressed to the learned, and not to the populace, is constantly defaced with coarse and vulgar abuse—*nebulones, deblaterare, impii, blasphemæ*, and similar terms, being amongst the most civil expressions applied to Protestant writers.

VOL. II

adequate means to express our reverence for that institution which confers such inestimable benefits upon us!

Theology.

But before we leave the doctrine of the Sacrament of the Lord's Supper, there is one more point on which we must briefly touch.

The nature of the Romish error concerning the sacrifice of the Mass has been already stated; but the corruption of a legitimate doctrine is not to prevent the expression of its truth. As the error of transubstantiation may not withhold us from acknowledging the primitive truth of the *reality* of the communion of the body and blood of Christ, so the erroneous doctrine of the sacrifice of the Mass need not restrain us from acknowledging that kind of sacrifice which has been so often and ably vindicated by the great writers of the Church of England. The following quotation from Archbishop Laud, on this point, will be found valuable: "And since here's mention happened of *sacrifice*, my *third* instance shall be in the sacrifice which is offered up to God in that *great* and *high* mystery of our *redemption* by the death of *Christ*; for as Christ offered up himself, once for all, a full and all-sufficient sacrifice for the sin of the *whole world*,—so did he institute and command a memory of this *sacrifice* in a Sacrament, even till his coming again. For at and in the *Eucharist* we offer up to God *three* sacrifices: One by the *priest* only; that's the *commemorative* sacrifice of Christ's death, represented in bread broken, and wine poured out. Another by the *priest* and the *people* jointly; and that is the *sacrifice of praise and thanksgiving* for all the benefits and graces we receive by the precious death of Christ. The *third* by every *particular man* for himself only; and that is the sacrifice of every man's *body* and *soul*, to serve him in both, all the rest of his life, for the blessing thus bestowed upon him. Now thus far the dissenting Churches (*i. e.* the Roman and English) agree, that in the *Eucharist* there is a sacrifice of *duty* and a sacrifice of *praise*, and a sacrifice of *commemoration* of Christ. Therefore, according to the former rule, (and here in truth too,) 'tis safest for a man to believe the commemorative, the praising, and the performing sacrifice, and to offer them duly to God, and leave the Church of Rome in this particular to her superstitions, that I may say no more." And would the Church of Rome stand to Archbishop Laud's rule, and "believe dissenting parties where they agree, were it but in this, and that before, of the *real presence*, it would work far toward the peace of *Christendom*. But the truth is, they pretend the *peace of Christendom*, but care no more for it, than as it may uphold at least, if not increase, their own greatness."—Laud, *Conference with Fisher*, s. 35, Num. 7, punct. 3.

In the notes in this passage (among many references in support of the text), the Archbishop says, "the ministration of the Holy Communion is sometimes of the ancient Fathers called an *unbloody sacrifice*; not in respect of any corporal or fleshly presence that is imagined to be there without blood shedding, but for that it representeth and reporteth to our minds that one and everlasting sacrifice that Christ made in his body upon the Cross. This Bishop Jewel disliketh not, in his answer to Harding, Art. 17, Div. 14. . . . And Dr. Fulke also acknowledges a sacrifice in the Eucharist. In *St. Matthew*, xxvi. 26."

The very writers, however, who maintain most strongly the doctrine of the Eucharist sacrifice, protest at the same time most strongly against the mischievous delu-

Theology. sion of the doctrine of the Mass by which it is said that a propitiatory sacrifice is there offered for the living and the dead. (See above, in the observations on the last paragraph, observation 2.)

This subject may be well closed in the words of one of our Homilies. In recommending simplicity and exact following of our Lord's commands in the celebration of our Lord's Supper, it is said,—

"For (as that worthy man St. Ambrose saith) he is unworthy of the Lord, that otherwise doth celebrate that mystery than it was delivered by Him. Neither can he be devout, that otherwise doth presume than it was given by the Author. We must then take heed, lest of the memory, it be made a sacrifice; lest of a communion, it be made a private eating; lest of two parts, we have but one; lest applying it for the dead, we lose the fruit, that be alive." (*First Part of the Sermon concerning the Sacrament.*)

And again in the same Homily,—

"It is well known that the meat we seek for in this supper is spiritual food, the nourishment of the soul, a heavenly reflection, and not earthly; an invisible meat, and not bodily; a ghostly substance, and not carnal; so that to think that without faith we may enjoy the eating or drinking thereof, or that that is the fruition of it, is but to dream a gross carnal feeding, basely objecting and binding ourselves to the elements and creatures. . . . Take then this lesson, O thou that art desirous of this table, of Emissenus, a godly Father, that when thou goest up to the reverend communion to be satisfied with spiritual meats, thou look up with faith upon the Holy body and blood of thy God, thou marvel with reverence, thou touch it with the mind, thou receive it with the hand of thy heart, and thou take it fully with thy inward man."

We may refer those who wish to enter further into this subject to Dr. Mede's *Christian Sacrifice*; Dr. Waterland, *On the Eucharist*; Johnson's (the Nonjuror) *Unbloody Sacrifice*; Hickes, *On the Christian Priesthood*; Bishop Bull's *Answer to Bossuet*; Bishop Patrick's *Mensa Mystica*.

It has, we must remark, been a subject of keen contention at various times, within the pale of our Church, whether the terms *sacrifice* and *altar* ought to be applied to the Eucharist and the Holy Table. Those who object to these terms have not so much fault to find with the doctrines of their opponents, when fairly stated, as with these names, because of the mischievous doctrines which have been mixed up with these names in the Roman Catholic Church. The dispute was very hot between Dr. Heylin (in his *Coale from the Altar*, 1636) and Bishop Williams (*Holy Table; Name and Thing*, &c. 1637) and others.

The Nonjurors sometimes defined a sacrifice to be, some material thing offered and dedicated to God, and made the oblation of the elements the chief point in the sacrifice. But Mr. Johnson, in his *Unbloody Sacrifice*, points out five particulars by which a sacrifice may be characterized: 1. An oblation of something material; 2, that this must be in acknowledgment of God's dominion, &c., and for the remission of sins; 3, that it should be offered on an altar; 4, by proper officers, and with proper rites; and, 5, that it must be consumed as God has appointed. It must be remembered that, among those who advocate the doctrine of a sacrifice in the Eucharist, there are different opinions; and some do not admit the offering of the elements to be a sacrificial act, &c. (About this difference of opinion Dr. Mede's *Christian Sacrifice* may be consulted, chap. i.) But the most objectionable portion of Mr. Johnson's view, as explained by its author, appears to be the second division. He is far removed from supporting the Romish view of "a propitiatory offering for the living and the dead;" but the second section of chapter ii. we think liable to much objection. We acknowledge that, by the whole sacrifice of prayer and praise, the faithful hope, in the language of our Liturgy, to receive all the benefits of our Saviour's passion; and we pray that our sinful bodies may thus be made clean by his body, and our souls washed by his blood; but *beyond this point* we feel that every step we take is

on ground fraught with great danger. Thus far our Church Theology. leads us; but it not only does not authorize us to make a single step beyond this statement, but it has warned us of the errors which the Romish doctrines have introduced by venturing further, and justly declared their pernicious nature in the strongest language used in our Articles. (Art. xxxviii.)

Bishop Davenant, in his *Determinationes* (Quæst. xiii., *Missa Pontificia non est sacrificium propitiatorium pro vivis et defunctis*), has some very able arguments against the Romish doctrine. In Melancthon's *Loci Theologici* (loc. xiii. p. 352, ed. 1557) there is a discussion on the nature of Sacrifices, which he divides into two classes:—1. *Propitiatory*, where a satisfaction is made for sins, which is available to others; but he says the only really propitiatory sacrifice in this sense is that upon the Cross, of which the Levitical were types, &c. 2. *Eucharistical* or *Thanksgiving Sacrifices*, as praise and prayer offered by those who are reconciled to God.

Before we leave this subject we must just call attention to the passage of *Malachi*, i. 11, usually cited by the Romanists as referring to their Sacrifice of the Mass. If the passage be referred to the Eucharist, as in the early ages of the Church it seems usually to have been, it will not serve to defend the views of the Romanists, as the reader of Dr. Mede's work may easily see. It was referred to the whole action of the Sacrament, not to any offering of our Lord's body, as carnally present. Others have denied its reference to the Eucharist. (See the *Downside Discussion*, p. 394-397.) We must also mention that, besides the view of Dr. Mede, another view was also maintained by Dr. Cudworth, who considers the Eucharist a *feast upon a sacrifice*. (See Cudworth's *Works*; and Waterland, *On the Eucharist*; Palmer, *On the Church*, pt. vi. ch. x. &c.)

Sect. 4.—On the Constitution of the Church, and on the Notes of the Church.

Having now considered the chief points relating to the Ministers of the Church, its Liturgy, and its Sacraments, we proceed to point out a few circumstances relating to its constitution, which could not have been conveniently introduced under any of these topics.

There is one subject which might have received notice in the above portions of this essay, that is, the celibacy of the Clergy: but on this point we shall only give a few references to those authors who have shown the untenableness of the Roman Catholic rule in regard to this point, both on Scriptural and ecclesiastical grounds. For Scripture we may appeal to 1 Tim. iii. Indeed Romanists themselves confess that it is not by any law of God, but by the statutes of the Church, that the marriage of persons in Holy Orders is forbidden. (See the references in Field, *Of the Church*, book v. chap. 57.) We may here subjoin an historical extract from Field. After mentioning the case of Novatus the Presbyter of Carthage, about whose wife Cyprian speaks, without blaming his marriage (but blaming his ill treatment of his wife), and that of Tertullian, whose marriage appears from his works, as well as the circumstance that he did not renounce his wife's society, Dr. Field proceeds,—

"Neither have we these examples only, but many more; for we read in Gratian (*Dist.* 56,) of the sons of Presbyters and Bishops that were promoted to the Papal dignity. So was Bonifacius the Pope, the son of Jucundus the Presbyter; Felix the Pope, the son of Fælix the Presbyter; Agapetus the Pope, son of Gordianus the Presbyter; Theodorus the Pope, son of Theodorus the Bishop; and many more he saith there were, who, being the sons of Bishops or Presbyters, were advanced to sit on the Apostolical Throne. And addeth, that when the sons of Presbyters and Bishops are said to have been advanced and promoted to be Popes, we are not to understand them to be such as have been born of fornication, out of lawful marriages, which were lawful to priests before the prohibition; and in the Oriental Church are proved to be lawful unto them even unto this day. Socrates saith (lib. iii. c. 21) that in *Thessalia* there was a particular custom grown in, that if a clergyman, after he became a clergyman, accompanied with his wife, while he married while he was yet a layman, he should be put out of the ministry of the Church. Whereas all the most famous Presbyters, and Bishops also, in the East, might if they pleased, but were no way by any law constrained to refrain from the company of their wives: so that many of them, even when they were Bishops, did beget children of their lawful wives. A particular and most approved example of which we have in the father of Gregory Nazianzen, who, being a bishop, not only lived with his wife till death divided them, but became the father also of Gregory Nazianzen (as

Theology.

worthy and renowned a man as any the Greek Church ever had), after he was entered into the priestly office, as appeareth by his own words, reported by Gregory Nazianzen (in *Carm. de Vita sua*). For after many motives used by him to Gregory Nazianzen, his son, to persuade him to assist him in the work of his Bishoply Ministry, the last that he most insisteth on, is taken from the consideration of his old age disenableing him to bear that burden, and perform that work, any longer that hitherto he had done. And therefore entreating him to put to his helping hand, he breaketh out into these words:—*Thou hast not lived so long a time as I have spent in the Priestly Office; therefore yield thus much unto me, and help me in that little time of my life that is yet behind; or else thou shalt not have the honour to bury me, but I will give charge to another to do it.* Here we see Gregory Nazianzen's father was employed in the Priestly function before he was born; and that therefore he became the father of so worthy a son after he was a Bishop, or at least a Presbyter. Neither was the father of Gregory Nazianzen singular in this behalf." . . . Chrysostome accordeth with Athanasius and Clemens Alexandrinus, and saith (in 1 Tim. iii.) "that marriage is in so high a degree honourable, that men with it may ascend into the Episcopal chairs; even such as yet live with their wives. For though it be a hard thing, yet it is possible so to perform the duties of a Bishop; whereunto Zozomen (lib. i. c. 11,) agreeth, saying of Spiridion, that though he had wife and children, yet he was not therefore any the whit more negligent in performing the duties of his calling; and of Gregorie Nyssene it is reported, that though he were married, yet he was no way inferior to his worthy brother that lived single."—Field, *Of the Church*, book v. ch. 57.

The reader will find a great deal more in this chapter to the same purpose, and a summary account of the manner in which a stricter practice began to prevail, and more stringent canons were enacted.

The present rule of the Eastern Church is, that deacons may marry and live with their wives after receiving priest's orders. In the Apostolical canons, it is forbidden to bishops and priests to leave their wives (Canon 6). And in the Council of Nice, when some were minded to order the priesthood to leave their wives, Paphnutius restrained them, and the assembly assented to his views. But while there is no question that the forcible annexation of celibacy to the priesthood was of gradual growth in the Church, we may remark that Bellarmine (*De Clericis*, lib. i. c. 18) seems to consider it certain, that if it be lawful to live with a wife married before ordination, there can be no unlawfulness in marriage after ordination. For more we may refer the reader to Field, *ubi supra*; to Palmer, *On the Church*; and to many other works which treat expressly on this point. Some curious testimonies from Romanists are adduced in the *Scheme for Union* proposed by Wicelius, *apud* Brown, *Fasciculus Rerum Expensarum*, &c., vol. ii. The credibility of the history of Paphnutius, impugned by Bellarmine, is defended by Field, *ubi supra*. We may also observe that Mr. Palmer (*Treatise of the Church*, part vi. ch. ix.) argues, that "as the Eastern Church held that there was nothing unlawful in continuing in the state of matrimony after ordination, while the Western held that there was no greater fault in contracting marriage after ordination, then we may fairly draw the conclusion that the Universal Church never condemned marriage after ordination." He remarks also, that "the Greek custom of allowing married clergy has never formed any obstacle to their union with the Roman Church."—Towneley, *De Ordinatio*, p. 649.—Palmer, *ubi supra*.

Unity of the Church

We have now briefly to consider the constitution of the Catholic Church in regard to its unity and universality. It has been common, in the controversies between the Church of England and of Rome, for each party to adduce what they term "Notes of the Church."

There are many different definitions of the Church; but that which the Church of England has adopted is the following:—

"The visible Church of Christ is a congregation of faithful men, in the which the pure Word of God is preached, and the Sacraments be duly administered according to Christ's ordinance in all those things that of necessity are requisite to the same" (Art. xix.); which definition is further explained by the 55th canon, "Christ's Holy Catholic Church, that is, the whole congregation of Christian people dispersed throughout

the world;" from which it would appear that this Article regards, not any one congregation, but the whole Church of Christ.

Theology.

That this whole body is spoken of in Scripture as one in some relations and respects, is a matter which admits of no denial; and the creeds enounce, as an article of the Christian faith, that we believe in the Holy Catholic Church: in Scripture, the Church is spoken of as being the Body of Christ, and Christ as being its Head (*Ephes. i. 22, 23; iv. 15; v. 23-32; Col. i. 18; 1 Cor. xii. 4-30, &c.*); a mode of speaking which clearly implies unity. It has been observed before, that while Scripture speaks of single congregations as churches, and also of national churches, it sometimes collects them all under one general term, as "the Church."

But, as in the present condition of the world, many different societies claim to be considered as members of this Body, differing widely from each other in most important points, men require some rules to which we can bring their several pretensions, in order to determine how far they are valid. The marks by which any society may be ascertained to belong to the true Church of Christ, are called the "Notes of the Church." But as these different societies, and especially Romanists and Protestants, are at issue in respect to many great and leading features of the Church, and as they cannot agree in the same conclusion, it is easy to see that each party must necessarily assign different marks as the distinguishing characteristic of the Church. The Notes appealed to, and insisted upon by the Romanists, are generally the following: *Antiquity, Succession, Unity, Universality, and Catholicity*. These are the chief Notes fixed upon by Bellarmine;* while others assign *Unity, Holiness, Catholicity, and Apostolicity*, as flowing from the Nicene Creed. (See De la Hogue, *De Ecclesia*, p. 11.) The Protestants have sometimes maintained the Notes of the Church to consist in the profession of the true doctrines of the Gospel, the right administration of the Holy Sacraments appointed by our Saviour, and an union under lawful and authorized ministers.

Every point on which these Notes of the Church touch, it is clear, involves a discussion in itself, and in its application to each particular case. Before we proceed more particularly to examine briefly some of the questions relating to the Notes of the Church, we must just allude to the promises contained in Scripture respecting its perpetuity. It will be sufficient to adduce the following passages:—

"I will make an everlasting covenant with them; and their seed shall be known among the Gentiles, and their offspring among the people; all that see them shall acknowledge them, and that they are the seed which the Lord hath blessed. (*Isaiah, lxi. 8, 9.*)

See also the prophecy of Daniel: "In the days of these kings shall the God of Heaven set up a kingdom which shall never be destroyed . . . and it shall stand for ever." (*Dan. ii. 44; compare Ps. xlv. 6, xlviii. 8, cxlv. 13, Is. ix. 7, Heb. i. 8, &c.*)

To these prophetic declarations we may annex the positive promises of our Lord, delivered on several different occasions; as, for example, the following passages:—"On this rock I will build my Church, and the gates of Hell shall not prevail against it" (*Matt.*

* It will be seen, in the extract from Mr. Palmer, given below, that Bellarmine adds other notes.

Theology. xvi. 18); "I will pray unto the Father, and he shall give you another Comforter, that he may abide with you for ever; even the Spirit of truth. (*John* xiv. 16, 17.) To these we shall merely add the last words of our Lord before his ascension into heaven: "Lo, I am with you always, even unto the end of the world." (*Matt.* xxviii. 20.)

These testimonies of Scripture are clear and decisive; and it may easily be shown, that from very early times it has been the belief of Christians that perpetuity is an essential attribute of the Christian Church. For the proof of this assertion, we may appeal to the creed itself, and to abundance of passages in the Fathers. It would be idle to place in the creed an acknowledgment of a belief in "the Holy Catholic Church," if that were a body liable to perish. With regard to the Fathers, we need only refer to the well-known passages of Athanasius, Jerome, and Augustine. "The word is faithful," says Athanasius, "the promise is unshaken, and the Church is invincible, though the gates of hell should come, though hell itself, and the rulers of the darkness of the world therein be set in motion."* (*Athan. Oratio, quod unus sit Christus*, tom. ii. p. 51, Benedictine edition.) "The Church may be assailed by persecutions," says Jerome, "to the end of the world, but cannot be subverted; . . . and this will be, because the Lord God Almighty, the Lord God of the Church, has promised that he will do so, whose promise is the law of nature." (Jerome, *Comm. in Amos*, towards the end.) And lastly, Augustine observes: "The Church shall not be overcome, it shall not be rooted up; nor shall it yield to any temptations, until the end of the world shall come." (*Enar. in Ps. LX.*)

The passages here quoted will be sufficient for our present purpose, especially as this is a doctrine not much controverted, and acknowledged in the confessions or formularies of most existing churches.†

It is needless to point out how consoling a truth this ought to prove to every Christian heart. The knowledge that the principles which we have maintained, however their prevalence may be clouded for a season, can never finally be overthrown, must prove to every high-hearted Churchman the best consolation under every passing affliction. The knowledge that the presence of Christ is promised for ever to his Church, is a safeguard against feelings of despondency, and an unfailing source of courage to the Christian warrior under every conflict for the faith.

For much of the matter in the above section, and in some few which follow, we are indebted to the *Treatise* of Mr. Palmer, and to the work of Dr. Field, *Of the Church*, but especially to the former. This general acknowledgment will suffice, instead of more specific reference.

With regard to the notes of the Church, selected by different classes of divines, the following extract from Mr. Palmer (part i. ch. ii.) will illustrate the different views entertained by various communities and theologians.

"The necessity of devising some general notes of the Church, and of not entering at once on controversial debates concerning

* We have availed ourselves of Mr. Palmer's translation of these passages.—Palmer, *On the Church*, pt. i. ch. i. s. 2.

† It may perhaps be worth while to adduce one more passage from St. Augustine. After quoting St. Paul's wish to depart and be with Christ, he adds: "*Dixit hoc quidem, sed quamdiu hic manere potuit? Num quid usque ad hoc tempus? Num quid usque in posterum? Ergo illorum abscessu deserta est Ecclesia? Absit! Pro patribus tuis nati sunt tibi filii. Quid est, Pro patribus, &c. Patres missi sunt Apostoli: pro Apostolis nati sunt ibi [tibi] filii, constituti sunt Episcopi. Hodie enim Episcopi, &c.*" Aug. *Enarrat. in Ps. XLIV.* vol. viii. p. 150, ed. 1616.

all points of doctrine and discipline, was early perceived by Christian Theologians. Tertullian appeals, in refutation of the heresies of his age, to the antiquity of the Church derived from the Apostles, and its priority to all heretical communities. (*Præscript. adversus Hæreticos.*) Irenæus refers to the unity of the Church doctrines, and the succession of her bishops from the Apostles. (*Adv. Hæreses*, lib. i. c. 10, lib. iii. c. 3.) The universality of the Church was more especially urged in the controversy with the Donatists. St. Augustine reckons among those things which attached him to the Church, the consent of nations, authority founded on miracles, sanctity of morals, antiquity of origin, succession of bishops from St. Peter to the present Episcopate, and the very name of the Catholic Church. (*Contra Epistolam Manichæi Fundamenti*, c. 45.) St. Jerome mentions the continual duration of the Church from the Apostles, and the very appellation of the Christian name. (*Dialogus c. Luciferianos.*) In modern times, Bellarmine, of the Roman school, added several other notes; such as, agreement with the primitive Church in doctrine; union of members among themselves, and with their head; sanctity of doctrine and of founders; efficacy of doctrine; continuance of miracles and prophecy, confessions of adversaries, the unhappy end of those who opposed the Church, and the temporal felicity conferred on it. (*De Ecclesia*, lib. iv. c. 3, &c.) Luther assigned, as notes of the true Church, the true and uncorrupted preaching of the Gospel; administration of baptism, of the Eucharist, and of the keys; a legitimate ministry, public service in a known language, and tribulations, internally and externally. (*De Ecclesia et quæ sint Notæ, &c.*) Calvin reckons only truth of doctrine, and right administration of the sacraments; and seems to reject succession. (*Institutiones*, lib. iv. c. 1, s. 7—9.) Our learned theologians adopt a different view in some respects. Dr. Field admits the following notes of the Church; truth of doctrine, use of sacraments, and means instituted by Christ; union, under lawful ministers; antiquity, without change of doctrine; lawful succession, i.e. with true doctrine; and universality in the successive sense, i.e. the prevalence of the Church successively in all nations. (*Of the Church*, b. ii. c. 1, 2, 5, &c.) Bishop Taylor admits as notes of the Church, antiquity, duration, succession of bishops, union of members among themselves and with Christ, sanctity of doctrine, &c."

This list might easily be increased, but it is unnecessary, especially since we are not obliged, as Mr. Palmer justly remarks, to follow implicitly the judgment of particular theologians, in selecting notes of the Church. Some of those of Bellarmine were soon rejected by many of the Romish theologians, (as may be seen from White's *Conference with Fisher*, 2, 9, in the case of miracles, p. 86, *et alibi*.) and are generally rejected by modern Romanists. In the same manner, then, we are at liberty to reject the opinion of private theologians on this subject. The Church of England has not formally enumerated the Notes of the Church, although in its Articles it has defined the Church, and made certain statements in other formularies concerning its constitution. These statements enable us to obtain an authoritative guide on some parts of this question, although they may not entitle us to fix finally all those points which are to be considered "Notes of the Church."

It must also be observed, that some Protestant writers maintain that the Church consists of the elect only. (See the notes on the following section.)

§ Of the Visibility of the Church.

Having shown that, according to Christ's promise, the Church is never to fail, but will endure to the end of the world, we next proceed very briefly to consider the visibility of the Church. By the visibility of the Church is meant the manifest public known existence of congregations, or churches, professing Christianity, and joining in external acts of public worship. (Palmer, *On the Church*, pt. i. ch. iii.) When it is maintained, in this sense, that the Church is, and always will be, visible, it is in opposition to a notion that Christianity is ever to be reduced to obscurity, or to be found only in the secret possession of a few scattered individuals. It may easily be shown, from several passages of Scripture, that the Church was to be thus visible. Thus Isaiah predicts (ii. 2) that it shall come to pass, in the last days, that the mountain of the Lord's house shall be established in the top of the mountains, and shall be

Visibility of the Church.

Theology. exalted above the hills; and all nations shall flow unto it." (Compare with this prophecy *Dan. ii. 35 & 44.**) The words also of our Saviour (*Matt. v. 14*), "Ye are the light of the world; a city that is set on an hill cannot be hid;" and his direction in the case of an offending brother, "tell it to the Church,"—both prove the same point. The latter direction would be unintelligible, if there were no visible Church. And again, from the Epistles of St. Paul, it is manifest that Christians were formed into visible societies by the Apostles; nor do we hear of individual believers, unconnected with their brethren in the possession of Christianity. The testimony of the early Fathers is also clear and decisive to the same great truth. The following quotations will suffice, as they are only specimens which may be supported by other similar statements. Irenæus, in his first book,† having spoken of the Church as having received the office of preaching the word of God and the true faith, goes on to argue, that though it is dispersed throughout the world, the difference of the nations and the languages does not interfere with the unity of the teaching, and then adds: "But as the sun is one and the same in every part of the world, so also this preaching of the truth shines everywhere, and illuminates every man who wishes to come to a knowledge of the truth." The Church has here the gift of preaching the Gospel, and the Gospel is like the sun in enlightening all the world. The Church that has this gift must surely be visible, or its teaching could not be so full of illumination. But in the passages quoted by Mr. Palmer (lib. v. ch. xx.), Irenæus maintains the same truth in more express words.

Cyprian says: "The Church of the Lord, full of light, diffuses her rays throughout the whole world. Yet the light, which is everywhere, is one, nor is the unity of the body separated."‡

In fact, all the Fathers considered the Church as visible throughout the world, in all its particular congregations or churches. The agreement of Christians in modern times upon this point is shown by Mr. Palmer,§ from the various confessions of the Protestant churches on the Continent; and he remarks, that the doctrine of the visibility of the Church was generally acknowledged by the Reformed, until some of them deemed it necessary, in their controversy with the Romanists, who asked them where their Church was before Luther, to maintain that the Church might sometimes be invisible.|| The Articles of our own Church speak plainly upon the subject, and its other authorized formularies are entirely in accordance with them, all concurring in representing the Church as a visible society.

While, however, we thus state the concurrence of

* See Augustin. *Enarrat. in Ps. XLIV.*, towards the end. After a long passage on the Church, he quotes the passage from Daniel, and connects it with that of St. Matthew, thus:—"Voce meâ (*Ps. iii.*) ad Dominum clamavi et exaudivit me de monte sancto suo. De quo monte? De quo dictum est, Non potest civitas abscondi supra montem constituta. Quem vidit Daniel ex parvo lapide crevisse, &c. . . . Ibi adoret qui vult occipere, ibi petat qui vult exaudiri, ibi confiteatur, qui vult sibi ignosci."

† *Contra. Hæres.* lib. i. cap. x. p. 49, ed. Massuet.

‡ Cyprian, *De Unitate*, p. 254, ed. Pamel.

§ Palmer, *On the Church*, part i. ch. iii.

|| This has been shown by Jurieu, in his *Système de l'Eglise*, who endeavours there to show that the Church is essentially visible, and that it never remained obscured, without ministry and sacraments, even in the time of persecution. See Palmer, *ubi supra*; Hooker, *Eccl. Pol.*, book iii. ch. i. s. 10; Field, *Of the Church*, book iii. ch. 8.

Theology. all authorities in this representation of the Christian Church, we must also briefly indicate the views of those who speak of the Invisible Church.

It is maintained by some of the divines of the Reformed churches, that the Church of Christ consists of the elect; but it is observed by Dr. Field, that they who use this language, and "define the Church to be the multitude of the elect, do so, not for that they think them only to pertain to the Church, and no others, but because they pertain unto it principally, fully, effectually, and finally; and in them only is found that which the calling of grace (whence the Church hath all her being) intendeth—to wit, such a conversion to God as is joined with final perseverance; whereof others failing and coming short, they are only in an inferior and more imperfect sort said to be of the Church."* In this sense, they who maintain that the Church is an invisible society, still acknowledge a visible Church, not as a separate body, but as that which containeth the former.† Hooker observes (book iii. ch. i. s. 9): "For lack of diligent observing the difference, first between the Church of God, mystical and visible, then between the visible, sound and corrupted—sometimes more, sometimes less—the oversights are neither few nor light that have been committed;" and he proceeds to name many of those which have occurred, but which we have not space to enumerate. We shall merely remark, that while we make no objection to the use of the phrase, the "Invisible Church," when thus understood, we always mean, when we name the Church in this treatise, the Visible Church of Christ.

The principal objections to this view have been well answered in Mr. Palmer's treatise, in the Appendix to chap. iii. of part iii. We may also refer to Bishop White's *Conference with Fisher the Jesuit*, p. 49—64; Hooker, &c. &c.

The perpetuity and visibility of the Church having been thus established, we proceed briefly to consider some of the Notes of the Church separately. The most convenient arrangement will be that derived from the articles of the Creed commonly called the Nicene. "I believe *One Catholic and Apostolic Church*;" and the corresponding article of the Apostles' Creed, the *Holy Catholic Church*: from which two expressions we may derive the four following Notes—*Unity, Holiness, Catholicity, and Apostolicity.*

Unity.

It has before been observed, that although in Scripture the word Church is often used of a single congregation, yet it is also used of one vast society, comprehending all such particular churches; and that this society is called the Body of Christ, who is said to be the Head of the Church. (*Ephes. i. 22, 23*; v. 23, *et alibi.*) These passages, therefore, indicate that this vast body is in some respects to be considered as one; and we ask at once in what this unity consists. There are two general heads under which the subject may conveniently be considered—Unity in *Communion*, and Unity in *Faith*.‡

* Field, book i. ch. 8.

† It must be added, however, that all the members of the Invisible Church cannot, in this view, be said to be contained in the Visible Church; because some, who will hereafter be saints, may not be, at present, converted. But it may be observed, in reply, that they are rather to be called *potentially* members of the Invisible Church, and not actually so, until their conversion and their reception into the Visible Church.

‡ The subject of Unity is viewed under different divisions in

Notes of the Church.

Unity of the Church

Theology.

1. *Unity in Communion.*—It is easy to show, from a multitude of passages in Scripture, the general duty of religious communion among Christians. It is to be inferred, in the first place, from the relation which is established between Christians: they are *brethren*; and nothing can present a stronger argument for unity and intercommunion than the analogy of a brotherhood. Again, Christians form one *body*, of which Christ is the head; and they are said to be "every one members one of another." (*Rom. xii. 5.*) Compare also with these passages those wherein our Lord commands us to *love* one another; and that remarkable prayer which he uttered "for all them that should believe in him," namely, that they might be *one*, even as He and the Father are *one*. (*John xvii.*) But we are not left to *infer* this duty; we are constantly warned in Scripture against *divisions*. Thus, St. Paul writes to the Romans, "Mark them which cause *divisions* and offences, contrary to the doctrine which ye have learned; and *avoid them*." (*Rom. xvi. 17.*) With this passage compare 1 *Cor. i. 10-12*; *Ephes. iv. 2, 3*; *Phil. ii. 2, &c.* We find still further, that these exhortations produced in the Apostolic age their due effect. We find that the churches were in the habit of saluting each other, in the Epistles of the Apostles; of aiding each other with mutual assistance; and of sending letters of recommendation to other churches with those of their brethren who were on their travels.

These circumstances, and many more which might be adduced, fully justify the conclusion, that "external communion between all Christians, in matters of religion, was instituted and commanded by God."*

The Scripture foundation being thus laid, we might proceed to show that this truth has been maintained by the Church from the earliest times; but our limits forbid our dwelling on that portion of the subject. We only remark, that if this be the command of God, they who wilfully violate this unity cannot escape the guilt of having broken one of the Divine commandments.

It only remains to point out the manner in which this duty of Christian communion may be violated. It is clear that as the Church was destined to be universal, the same teachers could not ordinarily instruct all nations. But then, the institution of particular churches, which was intended, not to *divide*, but to *organize* the universal Church, could not impair the fraternity which resulted from the mutual communion of these churches with God, and the duty of external communion with all Christians. From this view we perceive that the unity of communion in church might be violated in two different ways, *viz.*, by dividing the communion of a particular church, or that of the universal Church. The first occurs when professing Christians divide, or refuse to communicate with the particular church of which they are members; the other, when particular churches refuse to communicate with the universal Church—that is, with the great body of Christians.

The offence thus committed is the heinous sin of schism, against which we are frequently warned in Scripture (see 1 *Cor. i. 10*; *Rom. xvi. 17, 18*; *Heb. xiii. 17*; 1 *John ii. 19, 20*; *Jude 19*); and the mischievous and destructive nature of which is attested

Field, *Of the Church*, book ii. ch. 7. The above division is that adopted by Mr. Palmer.

* Palmer, *Treatise on the Church*, part i. ch. iv. § 1.

by the ecclesiastical authorities of every age of the Church.*

2. *The Unity of Faith.*—As our Lord, during his sojourn on earth, and afterwards by his Apostles and Evangelists, made a revelation of truths salutary and necessary to be believed, it is clear that all Christians are bound to believe all the doctrines thus revealed. Our Saviour promised to his disciples that the Spirit of truth should guide them into all truth (*John xvi. 13*); and his Apostles declare that there is but "one faith;" and that for that faith, once delivered to the saints, Christians are bound earnestly to contend. (*Ephes. iv. 5*; *Jude 3.*) The Church is also said by St. Paul to be established for the maintenance of the truth: "The church of the living God, the pillar and ground of the truth." (1 *Tim. iii. 15.*) The obligation of the Church to believe all revealed truth being established by these and similar declarations of Scripture,† it will follow that *heresy*, or the pertinacious denial‡ of some truth certainly revealed, is a sin of great enormity. That an obstinate rejection of revelation subjects us to God's eternal judgment, is plainly declared by our Lord himself: "He that believeth not shall be damned" (*Mark xvi. 16*); and heresy is a partial rejection of that truth, of which infidelity is the total denial. This passage, therefore, inculcates upon us the danger of denying any portion of revealed truth. But we are not left to gather the mischief of heresy by implication, as the Apostles most unequivocally condemn it. They warn those to whom they write that some of their teachers would pervert the Gospel; but that even if an angel from heaven were to preach any other gospel, he should be anathema: they speak of false teachers, who bring in damnable heresies; and they command their disciples neither to receive those who bring another doctrine§ into their house, nor to bid them God speed. In the *Revelations*, false doctrine is expressly stated to be hateful to God; and, lastly, the disciples are commanded, after one or two admonitions, to *reject* a man that is an heretic. (See *Gal. i. 7-9*; 2 *Pet. ii. 1*; 2 *John 7-11*; *Rev. ii. 15*; *Tit. iii. 10.*) The following passages from the earliest records of the Church show the sentiments then entertained of heresy. Ignatius|| writes thus to the Trallians:

"I exhort you, therefore, not I, but the love of Jesus Christ, to use only Christian food, and to abstain from such plants as are foreign to it,¶ which are heresy."

* See this fully proved in Mr. Palmer's *Treatise on the Church*, *ubi supra*.

† It seems hardly necessary to dwell at any length on this point, or the next, as it seems scarcely credible that any one should allow that God has made such a revelation to man as Christianity, and yet leave it a matter of indifference whether he believes it or not.

‡ Mr. Palmer has properly observed, that pertinacity is requisite to constitute heresy. Ignorance, or temporary error in ignorance, is entirely different from heresy. Field (*Of the Church*, book i. ch. 14, *in initio*) says, "Heretics are they that obstinately persist in error, contrary to the Church's faith;" and the language of Hooker is nearly similar.

§ In this passage the allusion is probably to the Gnostics, or to the Docetæ, who denied that the body of Christ was real, and considered it merely a phantom.

|| *Ignat. ad Trallianos*, ch. vi. p. 146, ed. Hefele; p. 332, ed. Jacobson.

¶ *ἡ ἀλλοτρίαν δὲ βοτάνην ἀπέχισθαι ἥτις ἐστὶν αἵρεσις.* Mr. Palmer translates, "from strange pasture, which is heresy." The passage which immediately follows, and concludes the chapter, is still stronger; but the first words of it are doubtful, the text being certainly corrupt.

Theology.

Irenæus says, "The Lord shall judge all that are without the truth, that is, without the Church" (Irenæus *adv. Hæres.* l. iv. c. 33, or 62, according to others). Tertullian declares, if they are heretics they cannot be Christians (*De Præscript.* c. 37); and Origen pronounces, that as the impure and idolaters shall not possess the kingdom of God, "so neither shall heretics."*

These explicit declarations against heresy might be multiplied to almost any extent, if it were needful; but the danger of heresy is almost universally believed, even by those who would differ the most widely in determining in what it consists.

As the mischief of heresy is so great, it is clear that every Christian church must have the power to exclude from its communion those who are guilty of it; a power which is obviously implied in several passages of Scripture, some of which have been already adduced (see *Tit.* iii. 10; *1 Tim.* vi. 5). And this power most Christian churches have exercised in the right, which they claim, of excommunication.†

We have, therefore, thus far established the two following positions:—

1. That the truth revealed by Christ must be believed by all Christians, in order to salvation; and
2. That heresy, or the pertinacious denial or perversion of the truth, is a grievous sin, and excludes from salvation.

These propositions being very general, and apparently very sweeping in their consequences, it is natural to inquire whether they are not subject to certain limitations; and we perceive at once that we should do great injustice if we considered every error to amount to heresy. Although in *matters of faith* (i. e. those distinctly revealed in Scripture, and attested by universal tradition) there is no latitude allowed, yet there are points, which are called *matters of opinion*, which may be controverted among churches without the unity of the faith being broken.‡ Again, even the Romish theologians grant that a doctrine which is apparently taught by Scripture and tradition, even if it prove to be an error, is not heretical, though denounced by particular churches, if the universal Church has not pronounced a judgment concerning it: even they hold that Transubstantiation and Purgatory were not matters of faith till defined by councils. In estimating also the guilt of heresy, we must make a due distinction between those who apostatize from the truth, having been educated in it, and those who, not having had an opportunity of knowing the truth in their early years, from having been brought up beyond the pale of the Church, and have embraced opinions which are in some points erroneous from their instructors, but who are not obstinate in error, but desire to embrace the truth revealed by Christ, whatever it may be. These considerations naturally present to us,

* Origen, *Ap. Pamphil. Apol.* tom. v. p. 225; *Oper. Hieron.* Paris, 1706; quoted by Mr. Palmer.

† Mr. Palmer justly observes, that "there are certain conditions requisite to a valid ecclesiastical judgment, which if plainly violated, render it null and devoid of all spiritual effect."

‡ "The Romish divines distinguish between theological opinions and doctrines *de fide*. Among the former they reckon the points contested between the Thomists and Scotists, the Jesuits and Dominicans, the Ultramontane and the Cisalpine parties; the doctrine of the immaculate conception of the Virgin, &c." (Palmer, part i. ch. v. § 3.) Thus the Romanists themselves allow this degree of latitude.

Theology. not any recommendation of error in itself, but some modifications in our judgments concerning those who hold it.

With regard to unity in faith, as a sign or note of the Church, we must observe, that although Christians are bound to receive all the truth revealed by Christ, and to desire a perfect union among all the brethren in matters of religion, yet that we have no certain promise that *in fact* the whole Church shall be always perfectly agreed in every point, and that no temporary differences shall ever arise in some particular doctrines. Still it is our duty, by all ordinary means, to endeavour to attain to such an unity; because we must infer that Christ has provided the whole Church with some means for preserving or recovering, within itself, unity in this respect; and we must suppose that there is a possibility of obedience to the precepts of believing all truth, and rejecting all false doctrines.

We may now observe, that actual unity in all matters of faith cannot be a sign of the Church, so as to distinguish it from all rival societies. It does not follow, because there is an apparent difference in doctrine, that there is a real difference in matters of faith; but where there is such apparent difference, the case must be a subject of discussion. We contend, then, that in no Christian society can a pretence be set up to an absolute and perfect apparent unity in doctrine. "It is not merely the Lutherans, Calvinists, and Zuinglians who differ. There are disputes in the Eastern churches; and in the Roman obedience (not to mention the differences about Jansenism) the controversies of Jesuits, Dominicans, and Augustinians, of Scotists and Thomists, of Ultramontanes and Cisalpines, are well known." (Palmer, *On the Church*, pt. i. ch. v. § iv.)

Besides, there may be an *unity of error*. Thus, the Nestorians are united in their erroneous views; but this unity does not prove theirs the true church.* We conclude, therefore, that *perfect* unity in faith is not a sign or *note* of the Church, as distinguishing one among rival claimants to the title of the true Church.

The foregoing observations on the Unity of the Church have been abridged from Mr. Palmer. The same subject is treated somewhat differently in Dr. Field, and in Dr. White's *Conference with Fisher*. Dr. Field (*Of the Church*, book ii. ch. 7), after mentioning the various sorts and degrees of unity found in the Church (1, the unity of origin and of calling; 2, in respect of the same end, whereunto all that are of the Church do tend, signified by the penny given to all the labourers, *Matt.* xx.; 3, the unity in respect of the same means of salvation, faith, sacraments, holy laws, &c. (see *Ephes.* iv.); 4, the unity in respect of the same spirit; 5, in respect of the same head,—even Jesus Christ; 6, the unity in respect of the mutual connection between Christians, &c.); and after pointing out the nature of the unity assigned by Romanists as a note of the Church, draws from it the following conclusion: "This is it, then, which they say, that wheresoever any company and society of Christians is found in orderly subjection to their lawful masters, not erring from the rule of faith, nor schismatically rent from the other parts of the Christian world by factious, causeless, and impious divisions,—that society of men is (undoubtedly) the true and not offending Church of God. This note, thus delivered, is the very same with those assigned by us."

It will be seen by this, that Dr. Field and other writers in some sort make unity a note of the Church, which seems at first sight a contradiction to the conclusion drawn in the text: but it is rather apparent than real. The spirit of unity must be found in the true Church—a desire after unity, and an honest endeavour to attain it; but the conclusion we have drawn is rather limited to the matter of fact: it is only denied above, that in endeavouring to ascertain the true church, such an unity can

* Palmer, *ubi supra*. Compare Field, *Of the Church*, book ii. ch. 7.

Theology. be appealed to as a matter of fact. It is not denied that every society which unjustly, *unnecessarily*, violates the unity of Christ's body is to blame, and so far cuts itself off from that body.

The Romanists, indeed, endeavour to persuade us that the churches of the Roman obedience are perfectly united, and are in fact the *one* Catholic Church. But this is an assumption on their part of the most unwarrantable nature. They have violated the unity of faith in imposing articles of belief which the primitive church not only did not impose, but would have rejected altogether (*e. g.* transubstantiation, &c.); but they have never at any time been the whole church of Christ. They conveniently forget the whole of the Greek Church in this argument. Nor are they so united in themselves in all respects, as has been intimated in the text, and as may be seen at greater length in Mr. Palmer's work, so often cited. In regard to the English Church, the Church of Rome is to be charged with the guilt of schism, not the Church of England.

Much useful matter will be found on these points in White's *Conference with Fisher*, p. 49-110; and in the other works already referred to in this essay.

We proceed now very briefly to consider the remaining notes of the Church, *viz.* its—

2. Holiness.
3. Catholicity.
4. Apostolicity.

Holiness.

The Holiness of the Church may be considered in several points of view. The sanctity of its Divine Head and its first founders; the holiness of its doctrines, and the means of holiness offered by its sacraments; the actual holiness of its members.

Holiness
of the
Church.

Now, there is no question that our Divine Head has called us to holiness, and he is himself its first fountain and spring. He gave himself for his Church, "that he might sanctify and cleanse it with the working of water by the word, that he might present it to himself a glorious Church, not having spot, or wrinkle, or any such thing; but that it should be holy, and without blemish."* (*Ephes. v. 25-27.*) The object, then, of the establishment of the Church being the sanctification of man, it is evident that no society of persons professing to be Christians can really belong to the Church of Christ, if it denies the obligation of good works, or if it teaches that its members may indulge in wickedness with impunity. On this point it is scarcely conceivable that any difference of opinion should exist; but great difficulty would arise if the *means* of holiness afforded by any society were to be considered as a *note* of the Church,† as this would include a thorough discussion of various opinions on the sacraments. Nor can the holiness of the individual members of a society properly be called a note of the Church. Some sectaries have indeed asserted that the Church consists only of the elect, or the visible holy. On the contrary, we must observe, that Scripture teaches us that the Church, or the kingdom of heaven, is like a field, where tares and wheat grow together for a time; or a net that is cast into the sea, and gathers of every kind, both the wicked and the just (*Matt. xiii. 24-50*), and that the separation of these two classes will not take place till the last day. In other words, although the

* In this passage it may be objected that the *invisible* Church is spoken of; but it may be replied, that the passage rather indicates the end and object of our Lord's sacrifice; and while it shows that the end is holiness, the expressions of sanctifying and cleansing indicate a process by which the *visible* Church is purified into the invisible. It is thus perfectly consistent with what follows respecting sinners in the communion of the visible Church.

† This is a different question from the lawful administration of the sacraments. We might justly affirm, that no society could be part of the Church of Christ in which the sacraments of baptism and the supper of the Lord were not duly administered.

invisible Church consists only of those who are finally accepted, yet that many will *outwardly* belong to the visible Church, who are devoid of a lively faith.

While, therefore, the true Church must enforce upon all its members the necessity of personal holiness, if they hope to continue *to the end* a portion of Christ's Church, yet the actual and visible holiness of its members is not to be made a test of the true Church. With regard also to the performance of miracles, as divine attestations of sanctity, we may determine that they must be excluded from the notes of the Church. The existence of holiness is entirely independent of them, and other notes would be required to ascertain whether any asserted miracle belonged to an exhibition of the power of God, or to that class of signs and wonders against which the Scripture warns us.*

Mr. Palmer observes, that the Donatists invented a distinction which more modern sects have adopted. They admitted that sinners might exist in communion with the Church, but they denied that manifest sinners could, in any respect, be of the Church. Mr. Palmer replies to this distinction by showing, that the fact that there are known sinners in any church, does not annihilate its character, or render it apostate. (See *1 Cor. iii. 3, vi. 1-7, v. 1-5; Rev. ii. 18, 20, iii. 1, 4*). Such persons cannot, of course, belong to the Church, considered in its invisible character. Against the notion, that the *visible holiness* of life is requisite for admission into the Church, Mr. Palmer argues that baptism is the only mode of admission into that body, and that the requisites for baptism are a profession of repentance, and faith in Christ—of willingness to obey his laws, and believe his words.

Catholicity.

Among the many characteristic features of the Christian, there is scarcely any by which it is more clearly distinguished from the Jewish Church, than by its universal diffusion over the world. This difference is not incidental, but essential.

The Jewish Church, by the very nature of its ordinances, was restrained to Jerusalem and the country in which it was placed; the last command given by our Saviour to his Apostles plainly intimated that his Church was to extend to all the nations of the world. (*Matt. xxviii. 19, 20.*) This characteristic was also predicted from the time of the earliest promises given to the descendants of Abraham (see *Gen. xxii. 18; Is. ii. 2; Ps. ii. 8, &c.*); and as there is no limitation to any particular period, we must understand these predictions to declare the *permanent* condition of the Christian Church. The notion of a mere successive universality is altogether untenable.† It can scarcely be needful to produce any testimonies from the ancient church to this great truth, as the acknowledgment of the Nicene Creed, and of the *Te Deum* (the holy Church throughout all the world doth worship thee), are sufficient vouchers for its general reception. It may be more satisfactory to close these brief observations with an extract from an eminent Protestant prelate.

Archbishop Usher, in his sermon before the king, from *Ephes. iv. 13*, speaks thus:—

"For the Catholic Church is not to be sought for in any one angle or quarter of the world; but among 'all that in every place call upon the name of Jesus Christ our Lord, both theirs and ours.' (*1 Cor. i. 2.*) Therefore to their Lord and ours it was said (*Ps. ii. 8*), 'Desire of me, and I will give thee the heathen for

* See Palmer, part i. ch. vi.

† It must be remarked, however, that Bellarmine and other Romanists, as well as some of our theologians, have countenanced this notion. See the remarks on this subject in Palmer, part i. ch. vii.

Theology. thine inheritance, and the uttermost parts of the earth for thy possession; and to this mystical body, the Catholic Church, accordingly, 'I will bring thy seed from the East, and gather thee from the West; I will say to the North, give up; and to the South, keep not back; bring my sons from afar, and my daughters from the ends of the earth, even every one that is called by my name.' (*Isaiah* xliii. 5.)

"Thus must we conceive of the Catholic Church, as of one entire body, made up by the collection and aggregation of all the faithful unto the unity thereof; from which union there ariseth unto every one of them such a relation to, and dependence upon the Church Catholic, as *parts* used to have in respect of their *whole*. Whereupon it followeth, that neither particular persons, nor particular churches, are to work, as several divided bodies, by themselves (which is the ground of all schism); but are to teach and to be taught, and to do all other Christian duties, as parts conjoined unto the whole, and members of the same commonwealth or corporation; and therefore the bishops of the ancient Church, though they had the government of particular congregations committed unto them, yet in regard of this communion which they held with the Universal, did usually take to themselves the title of *Bishops of the Catholic Church*: which maketh strongly as well against the new *Separatists* as the old *Donatists*; who either hold it a thing not much material,* so they profess the faith of Christ, whether they do it in the Catholic communion or out of it, or else (which is worse) dote so much upon the perfection of their own part, that they refuse to join in fellowship with the rest of the body of Christians, as if they themselves were the only people of God, and all wisdom must live and die with them and their generation." (Usher's *Sermon*, p. 6, 7; ed. 1631.)

This statement of the archbishop places the great dogma of the Catholicity of the Church in a very clear point of view; and it is obviously unnecessary to multiply quotations on a point which will not be much disputed. It only remains to observe, that this Catholicity is rather an *attribute* of the whole Church than a *note* to distinguish one body of Christians from another as the Church of Christ. It serves, however, thus far as a note of the Church, that it condemns those who wilfully and unnecessarily form a body of separatists, and indicates that we are not to look for the Church of Christ among such a society.

In reference to this attribute of the Christian Church, we may refer to Field, *Of the Church*, book ii. ch. 8 & 9; White's *Conference with Fisher*, p. 109-11; who answers the Romish pretence of universality by observing that the Roman Church is only a particular church. Archbishop Usher also, in the sermon quoted above, answers the common, but absurd question addressed by Romanists to Protestants, "Where was your Church before Luther?" "Whereunto," this prelate observes, "an answer may be returned from the grounds of the solution of the former question: that our Church was even there where now it is. In all places of the world, where the ancient foundations were retained, and these common principles of faith, upon the profession whereof men have been wont to be admitted, by baptism, into the Church of Christ: there, we doubt not, but our Lord had his subjects, and we are fellow-servants; for we being in no new faith, nor no new church; that which in the time of the ancient Fathers was accounted to be *truly and properly catholic*, namely, *that which was believed everywhere, always, and by all*;† that in the

succeeding ages has evermore been preserved, and is at this day entirely professed in our Church," &c. Theology.

For other authorities, see Palmer, *On the Church, ubi supra*, from which this and the preceding sections have been chiefly abridged.

Apostolicity of the Church.

It is admitted by all that the Church is Apostolical, or in some sense derived from the Apostles. Now, every society which is derived from them must be so by spiritual propagation, or derivation, or union; not by separation from the Apostles, or from churches planted by them, or derived from their preaching, under pretence of establishing a new system of Apostolical perfection.* But there is another point of view in which the Church may be considered to be Apostolical; which is, in the authority and succession of its ministry. It will readily be acknowledged that the Apostles not only fulfilled the command of Christ in teaching all nations, but that they constituted presbyters in every church, and that their appointment of ministers was sanctioned by the authority of our Saviour himself and by the Holy Spirit of God. (Compare *Ephes.* iv. 8-15; *Acts* xx. 28; *1 Cor.* xii. 28.) The appointment, therefore, of ministers rests on the practice of the Apostles and the authority of the Holy Spirit. And the opinion of all Christians (with, perhaps, the exception of the Quakers) has been, that this institution is permanent in its nature, and absolutely essential to the Christian Church. St. Ignatius, in speaking of the ministry, says, "without these there is no church" (*Ignat. ad Trall.* § 3); and St. Jerome says, "*Ecclesia non est, quæ non habet sacerdotes*" (*Hieron. Ad. Lucifer.*); and ample testimonies to the same sentiments may be produced from every period of the Church.† We may conclude, therefore, that the ministry is essential to the Christian Church. The Scriptures also teach us that a divine vocation is essential to the Christian ministry. The example of the Old Testament, and the explicit declaration of St. Paul, in the *Epistle to the Hebrews* (ch. v. 4, 5, &c.), assure us that the high office of the ministry is not to be assumed at man's pleasure, but to be received from God's appointment,—that no one can be a legitimate minister of God's Church except he is authorized by Him. (Comp. *Heb.* v. 4; *Rom.* x. 15; *2 Cor.* ii. 9; *Is.* lxii. 1.) Now, in considering what constitutes such a vocation, we must observe that an inward call and a popular election are both entirely insufficient alone to constitute a minister of Christ's Church. There is no instance in Scripture of any man being sent forth as a minister of Christ merely on the strength of an inward call, unattested either by miracles or by an external commission from the ministers of God.‡ Nor is there in Scripture any example of a popular election of ministers independently of the sanction of the Apostles. The seven deacons named by the people were afterwards ordained by them. The Apostles *ordained elders in every city* (*Acts* xiv.); and St. Paul appointed Timothy and Titus as chief pastors in Ephesus and Crete, that they *might ordain presbyters in every city*. And it is quite

* Palmer, *On the Church*, part i. ch. viii.; from whom this section is chiefly abridged.

† The great communities of foreign Protestants acknowledged this truth in most of their confessions, e. g. the Augsburg, Helvetic, Belgic, &c.

‡ We may make almost the same observation with regard to God's revelations in the Old Testament. The inward impulse can be no sign to any other individual, as we have remarked in a former chapter—ch. ii., section on special revelations.

* See Augustin. *Ep.* 48.
† *In ipsâ Catholicâ Ecclesiâ magnopere curandum est, ut id teneamus quod ubique, quod semper, quod ab omnibus creditum est: hoc est enim verè proprièque Catholicum.* (Vincent, *Lirin. contr. Heres.* c. 3.)

Theology. uncertain whether the people had any share in these appointments. It is, indeed, acknowledged by dissenters, that "no case occurs in the inspired history where it is mentioned that a church elected its pastor."* The very circumstance of persons *heaping to themselves teachers after their own lusts* is one of the signs marked out of a great apostasy (2 Tim. iv. 3, 4); which shows distinctly that such elections cannot of themselves be sufficient to constitute a legitimate commission. In the primitive Church, indeed, it is acknowledged that sometimes the people elected their pastors; but the ministers of Christ always confirmed and ordained those who were so elected. We come now to the last stage of this inquiry, which points out to us the mode in which it has pleased the Almighty that the Christian ministry should be perpetuated. It has been shown that neither internal vocation nor popular election can prove a legitimate commission from God. Only one mode, therefore, remains by which men can receive a Divine commission for the sacred office; that is, by means of ministers authorized to convey it to others. It is clear that if God authorized the Apostles and their successors to ordain ministers, and transmit to them a Divine commission, there would then be a clear and intelligible mode in which this commission might be perpetuated in the Church. Accordingly, Christ did so; he gave to the Apostles his own mission: "As my Father hath sent me, even so send I you" (John xx. 21); empowering them to give to *others* the mission which, by the very act of conferring it on the Apostles, he showed to be transmissible. They did transmit it to others; and thus alone were the ministers of Christ appointed. Those thus appointed were said to be constituted by the *Holy Ghost* (1 Cor. xii. 28), and were called *pastors and teachers set by God* in his Church. (Acts xx. 28.) That the succession of such ministers was never to fail, is implied in the promise of our Lord to his Church: "Lo, I am with you to the end of the world." (Matt. xxviii. 20.) We infer from these premises, that an Apostolical succession of ordinations is essential to the Christian ministry; and with this proposition we conclude our remarks upon the Notes of the Church.

It will be observed that the greater part of the above observations on the Perpetuity, Visibility, and Notes of the Church, is an abridgment of the first part of Mr. Palmer's *Treatise on the Church*, and sometimes even in his very words. Although other authorities have constantly been used, we have taken this course because no writer has treated the matter more lucidly; and the brevity with which we have been obliged to write required, as a primary element, the utmost clearness of arrangement. For further satisfaction on each of the above topics, and on the other points connected with the Church, we must refer to that work, to the other treatises already quoted, such as Field, White, Hooker, Laud, &c., and to other great writers of our Church, e. g. Barrow (*On the Supremacy of the Pope*), Bishops Taylor, Hall, Jewell, &c. In the *Determinations* of Bishop Davenant many points will be found very ably maintained against the tenets of the Romanists. Some very valuable matter will also be found in a small compass in Archdeacon Fullwood's *Established Church*, London, 1681, and *Leges Angliæ*. We may just observe, that some of the arguments of the Romanists admit of a very easy and obvious answer. When they claim dominion over the whole Church in right of antiquity, and as the mother of all churches, it is sufficient to reply, that the Church of Jerusalem is more properly to be called the mother of all churches. But many of the subjects in controversy between the Churches of England and Rome we are obliged to pass over, as the discussion of them would far exceed our limits. The great question between them (that of Scripture and Tradition) has been considered with much detail in Chap. II., and this forms the

* J. A. James *Church Member's Guide*, p. 12, second edition.

foundation of their difference. If the principles there advanced are founded in truth, as we can have no doubt that they are, the chief weapon of popery is broken, and its main support undermined, and the war need not be carried on in detail. With these observations, referring once more to the great authorities already cited, we take leave of this portion of our subject.

Sect. 5.—On the Doctrine of Scripture relative to a Future State.

In the first chapter of these outlines, some remarks were made on the belief of the heathen world in a future state of existence for man. Although many of the wisest heathens appear to have entertained such a belief, yet all their views were marked with great uncertainty and vacillation concerning the nature of that condition. All this uncertainty, all those doubts and difficulties, vanish at once before the clear light of the revelation of Jesus Christ, who brought life and immortality to light. It is the main doctrine of the Scriptures, that man is destined for another world, compared with the transcendent importance of which, all the concerns of this life fade into utter insignificance. The declarations of Scripture on this subject are so clear and decisive, that we may bring into a very small space the most important points which it has pleased God fully to reveal; and we may afterwards direct attention to some inferences which may fairly be drawn from those intimations which contain less definite information. The great outlines of the teaching of Scripture on this subject are so clearly marked as to leave no room for doubt that our future state will be eternal, that our happiness or misery in that state will be dependant on the manner in which we have passed through our time of probation here, and that the final condition of every human being will be determined at that day when God shall judge the world by Jesus Christ.* (Matt. xxv. 31–46; Acts xvii. 31; Rom. ii. 16, xiv. 9, 10; 2 Cor. v. 10, &c.)

But before the revelation made to us in the New Testament is considered, the notions of the Jews require a very brief examination. At the time of our Saviour it is clear, from many intimations, that although the party of the Sadducees† denied the doctrine of a resurrection, yet that a general belief in it was prevalent. We may gather this from the language of Martha, the sister of Lazarus, when she said to our Lord, "I know that he shall rise again in the resurrection at the last day." (John xi. 24.) But we may ascend far higher for the antiquity of this belief, as Bishop Bull‡ and others have shown, and show that the prophets and patriarchs looked not only for a temporal reward, but for an abiding home. It is readily

* See Barrow, *Sermons on the Creed*, sermon xxxii.; Pearson, *On the Creed*; H. More, *Mystery of Godliness*, book vi., &c.

† Bishop Bull observes, on this point: "In a word, the doctrine of a future life and judgment continued inviolate and unquestioned among the Jews till after their return from the captivity. After which time (exactly how soon, or how long after, seems to me uncertain), there arose the heresy of the Sadducees, who believed neither the immortality of the soul nor the resurrection of the body, nor the judgment to come. But concerning these Josephus (*Ant.* xviii. 2) observes, that "though they were generally rich and great men" (their principles leading them to mind and seek after the riches and honours of this world), "yet they were very few in number, compared to the rest of the Jews." (Bull, sermon viii., *On the Vanity of this Life, and the Eternity of the Next*, vol. i. pp. 207, 208, Burton's edition.)

‡ Sermon viii. *ubi supra*; and sermon xiv., *On the Recompence of the Reward*, in which Bishop Bull shows that the doctrine of a recompence after life was believed by the people of God before the law was given, &c.

Theology. acknowledged that in the Mosaic law future rewards and punishments were not made the principle of the covenant; but our Lord has shown us how the great doctrine of a resurrection was implied in the language of the *Pentateuch*, and ought to have been inferred from it by the Jews. But the belief in a resurrection was prevalent both in the patriarchal and in the Jewish Church; in the last of which it seems to have attained perhaps a more clear and definite form as the day of our Lord's appearance approached. It is not perhaps possible to trace very accurately the first origin, or the subsequent progress, of this belief, although we must consider it to have resulted from a Divine revelation; but its existence is testified by many passages of Holy Writ. The translation of Enoch must have been an evidence to his contemporaries, and to succeeding generations, that man was destined for immortality; and Enoch himself prophesied distinctly of the day of judgment, as the apostle Jude has informed us.* (*Jude*, verses 14 & 15.) Having quoted this antediluvian testimony, Bishop Pearson proceeds thus: "The testimonies which follow, in the Law and in the Prophets, the predictions of Christ and the Apostles, are so many and so known, that both the number and the plainness will excuse the prosecution. The throne hath been already seen, the Judge hath appeared sitting on it, the books have been already opened, the dead, small and great, have been seen standing before him; there is nothing more certain in the Word of God, no doctrine more clear and fundamental, than that of *eternal judgment*." (*Heb.* vi. 2.)

One or two clear testimonies from the Old Testament may here be referred to: Job proclaims his belief that his "*Redeemer shall stand at the latter day upon the earth*," and that "*though worms destroy his body, yet in his flesh shall he see God*" (*Job* xix. 25, 26); and Daniel speaks of a day when "*many of them that sleep in the dust of the earth shall awake, some to everlasting life, and some to shame and everlasting contempt*." (*Dan.* xii. 2.)† To these testimonies to a judgment and a life to come, many others might be added, from other parts of Scripture; but it is scarcely needful, as what has been advanced will be considered sufficient to maintain the statement of the viith Article of the Church of England, "Wherefore they are not to be heard, which feign that the old Fathers did look only for transitory promises."

We proceed now briefly to advert to the information communicated in the New Testament as to the future state of man.

* Bishop Pearson (*On the Creed*, art. vii.) appeals, as a proof of a judgment to come, to the intimation given to Cain, "*If thou doest well, shalt thou not be accepted? and if thou doest not well, sin lieth at the door*" (*Gen.* iv. 7): "which," he says, "by the most ancient interpretation, signifieth a reservation of his sin unto the judgment of the world to come." (See the *Targum* of Jonathan, the *Jerusalem Targum*, and that of Onkelos, as quoted by Bishop Pearson.) This interpretation has, however, been disputed; and others have interpreted the word here translated "*sin*" to mean, as it does sometimes, a *sin-offering*; i. e. you have the means of atoning for your sin, and reconciling God to you again.

† On these two passages see Bishop Pearson, *On the Creed*, art. xi. Some have attempted to give an entirely different explanation to the words of Job, but we think without much success.

For further testimonies see Bishop Bull (sermons viii. & xiv.); Barrow, *On the Creed*, sermon xxxii.; Burnet, *On the Articles*, art. vii. The *Psalms* and the *Book of Ecclesiastes* are especially referred to by most writers on these points.

It is, then, clearly the doctrine of the New Testament that "God hath appointed a day in which he will judge the world in righteousness, by that man whom he hath ordained, whereof he hath given assurance in that he hath raised him from the dead." (*Acts* xvii. 31.) This declaration is more fully made manifest to us in another passage of Scripture, in which we are informed of the grounds on which the decision of the judge will be made: "For we must all appear at the judgment-seat of Christ, that every one may receive the things done in his body, *according to that he hath done, whether it be good or bad*." (*2 Cor.* v. 10.) These two passages establish the great facts, that God hath appointed a day in which the whole world shall be judged, that Christ shall be the judge, and that men shall be judged according to their works done in this world. There is one particular more left to be supplied—the consequence of the sentence then to be delivered by the Judge. Our Saviour himself, who has given an account of this awful day, of which the above passage of St. Paul is a reiteration and summary, has added this particular, in language which it is impossible to read without a feeling of solemnity and awe. He informs us that all nations shall be gathered before him, and a separation having been made between those who have done his will, and those who have not, that HE will then say to the one, "Come, ye blessed of my Father, inherit the kingdom prepared for you from the beginning of the world;" and to the others, "Depart from me, ye cursed, into everlasting fire, prepared for the devil and his angels;" and he closes this fearful statement by adding, "And these shall go away into everlasting punishment; but the righteous into life eternal." (*Matt.* xxv. 31–46.)

From these and other passages it is abundantly manifest that a solemn day of judgment is appointed, at which each man shall receive his final sentence from the Judge, and that this sentence leads to a final state of everlasting happiness to those who are accepted in that day, and of everlasting misery to those who are then to be banished from the presence of God for ever. These declarations are at once so clear, that they need no comment, and so solemn and awful, that nothing which man can add to them would be calculated to heighten the impression they must make on every rightly constituted mind. We therefore leave them in the plainness and simplicity with which Scripture commends them to our most earnest and serious thoughts, and proceed to close this essay with a few considerations concerning some points, which we left so far unexplained, that we must be humble-minded and content with mere inferences; while they are so far revealed, that we seem almost invited and encouraged to make such inferences.

It must not be imagined, from what is here asserted, that our works in Scripture are represented as an efficient cause of our salvation. There can be no doubt that, from the whole tenor as well as the express declarations of Scripture, we have reason to conclude, that although we are judged according to our works, the efficient cause of our salvation is only the righteousness and the merits of our Lord and Saviour Jesus Christ. Bishop Bull, in his viith sermon (*On different Degrees of Bliss in Heaven*), makes the following observations on this subject. In order to answer an objection, that since the future glory of the saints is the purchase of Christ's righteousness, which is imputed alike to all true believers, and therefore they shall all share equally in the future glory, he observes, that the doctrine of the imputed righteousness of Christ, in the manner in which it is too commonly taught, has no foundation in Scripture; and then proceeds thus:—

"But to answer more directly to the objection, there is nothing

Theology.

more certain than that the future glory of the saints is the purchase of Christ's righteousness. But how? By the meritorious obedience of Christ, in his life and death, a covenant of grace, mercy, and life eternal was procured, ratified and established between God and the sinful sons of men: the condition of this covenant is *faith working by love*, or a faith fruitful of good works; and there is also sufficient grace promised to all that shall heartily seek it, for the performance of that condition. It is from this covenant of infinite mercy in Christ Jesus alone that our "good works have any ordination to so excellent a reward as the future glory; and it is the mercy, the rich mercy, the royal bounty and liberality of God, expressed in the same covenant, that assigns to greater degrees of grace here, greater degrees of glory hereafter." (Bull's *Works*, vol. i. p. 185-6, ed. Burton.)

Two questions appear naturally to arise from the truths which have just been set forth:—

1. What is the intermediate state between death and judgment?

2. What is the nature of the happiness to be bestowed upon the blessed?

With regard to the first question, it appears to be the opinion most consonant to Scripture and to the judgment of the primitive Church, that the soul of man at once passes into a state of happiness or misery, but that this condition is imperfect until the resurrection of the body and the final consummation of all things. Under this view the prayer in our burial service appears to be composed, which entreats God to hasten his kingdom, "that we, with all those that are departed in the true faith of thy holy name, may have our perfect consummation and bliss" in his eternal and everlasting glory. This notion is entirely inconsistent with the purgatory of the Romanists; but as that subject has already been discussed in another portion of this work (Misc. Diy., art. PURGATORY), it will not be necessary to enter upon the arguments connected with that opinion. Those who wish to pursue the subject further, will find much assistance from Bishop Bull's *Sermons* on this subject (sermon ii. & iii. of vol. i. in Dr. Burton's edition).

We have not here entered at length into the doctrine of the resurrection of the body, as it is clearly the doctrine of Scripture. The resurrection of our Lord's body, and the declaration of his apostle, that he shall make our bodies like unto his glorious body (*Phil.* iii. 21; compare *1 John* iii. 2), with many other cogent passages from the New Testament, are sufficient to set forth this doctrine; but to enter upon it fully would exceed our limits. We may refer those who wish to pursue the subject to Pearson, *On the Creed*, and to Bishop Butler's *Essay on Personal Identity*.

With regard to the second question, our information is confessedly only scanty. The terrors of the next world to the disobedient are set forth very plainly, and

in language calculated to strike the careless; to *them* Theology. Scripture speaks of the worm that dieth not, and the fire that is not quenched; but as the promises of glory are addressed to those who love God, it is sufficient that God should assure them that their happiness will then be his care. They have that trust in God which persuades them that what he prepares for them that love him must be supremely happy, and thoroughly adapted to their condition. It is probable that we are not capable at present of understanding the nature of our future condition in any detail. We may, however, gather many *practical* precepts from what is revealed to us. We perceive at once that a nearer approach and greater knowledge of God are amongst the privileges of that condition; which immediately suggests to us the necessity of cultivating holy habits here below, as without them heaven itself would be no place of happiness for us. A more immediate approach to God's presence is promised to us: "we shall see him as he is" (*1 John* iii. 2; compare also *Rev.* xxi. 22, 23); and Him whom we must now worship through ordinances, and as unseen, we shall then be allowed to approach immediately to see him face to face. The passage of the *Revelations*, also just alluded to, suggests another great change in our nature. In the state in which we live on earth, rest is necessary for the wearied body and the jaded mind; but in that glorified condition there shall be no night, and, consequently, no satiety of bliss, no desire for rest; for heaven itself is represented to us as one enduring state of rest; a condition which shall need no vicissitudes, for all shall be supremely blessed. These considerations might easily be multiplied; but it is better, perhaps, to close this treatise with a caution against attempting to be wise above that which is written, and to allow our souls, in confidence and joy, to repose on that most encouraging and cheering description of the happiness of the world to come contained in the following words of Holy Writ:

"I heard a great voice out of heaven, saying, Behold, the tabernacle of God is with men, and he will dwell with them, and they shall be his people, and God himself shall be with them, and be their God.

"And God shall wipe away all tears from their eyes, and there shall be no more death, neither sorrow nor crying, neither shall there be any more pain; for the former things are passed away." (*Rev.* xxi. 3, 4.)
